**(54) Title:** TRUSTED INFRASTRUCTURE SUPPORT SYSTEMS, METHODS AND TECHNIQUES FOR SECURE ELECTRONIC COMMERCE, ELECTRONIC TRANSACTIONS, COMMERCE PROCESS CONTROL AND AUTOMATION, DISTRIBUTED COMPUTING, AND RIGHTS MANAGEMENT

**(57) Abstract**

The present inventions provide an integrated, modular array of administrative and support services for electronic commerce and electronic rights and transaction management. These administrative and support services supply a secure foundation for conducting financial management, rights management, certificate authority, rules clearing, usage clearing, secure directory services, and other transaction related capabilities functioning over a vast electronic network such as the Internet and/or over organization internal Intranets. These administrative and support services can be adapted to the specific needs of electronic commerce value chains. Electronic commerce participants can use these administrative and support services to support their interests, and can shape and reuse these services in response to competitive business realities. A Distributed Commerce Utility having a secure, programmable, distributed architecture provides administrative and support services. The Distributed Commerce Utility makes

optimally efficient use of commerce administration resources, and can scale in a practical fashion to accommodate the demands of electronic commerce growth. The Distributed Commerce Utility may comprise a number of Commerce Utility Systems. These Commerce Utility Systems provide a web of infrastructure support available to, and reusable by, the entire electronic community and/or many or all of its participants. Different support functions can be collected together in hierarchical and/or in networked relationships to suit various business models and/or other objectives. Modular support functions can be combined in different arrays to form different Commerce Utility Systems for different design implementations and purposes. These Commerce Utility Systems can be distributed across a large number of electronic appliances with varying degrees of distribution.

**TRUSTED INFRASTRUCTURE SUPPORT SYSTEMS,  
METHODS AND TECHNIQUES FOR  
SECURE ELECTRONIC COMMERCE, ELECTRONIC  
TRANSACTIONS, COMMERCE PROCESS CONTROL  
5 AND AUTOMATION, DISTRIBUTED COMPUTING, AND  
RIGHTS MANAGEMENT**

**Field of the Inventions**

These inventions generally relate to optimally bringing the  
efficiencies of modern computing and networking to the  
10 administration and support of electronic interactions and  
consequences and further relate to a secure architecture enabling  
distributed, trusted administration for electronic commerce.

These inventions relate, in more detail, to a "Distributed  
Commerce Utility" – a foundation for the administration and  
15 support of electronic commerce and other electronic interaction and  
relationship environments.

In still more detail, these inventions generally relate to:

- efficient administration and support of electronic  
commerce and communications;
- 20 • methods and technologies for electronic rights  
administration and support services;
- techniques and arrangements for distributing  
administration and support services such as secure  
electronic transaction management/administration,  
25 electronic process control and automation, and clearing  
functions across and/or within an electronic network  
and/or virtual distribution environment; and/or

- clearing, control, automation, and other administrative, infrastructure and support capabilities that collectively enable and support the operation of an efficient, secure, peer-to-peer collection of commerce participants within  
5 the human digital community.

### **Background**

- Efficient, effective societies require capabilities enabling their inhabitants to control the nature and consequences of their participation in interactions. Every community needs certain basic  
10 services, facilities and installations:
- the post office delivers our mail,
  - the schools teach our children,
  - the highway department keeps our roads passable and in good repair,  
15
  - the fire department puts out fires,
  - the power company delivers electrical power to our homes,
  - the telephone company connects people and electronic devices near and far and provides directory services  
20 when you don't know the right number,
  - banks keep our money safe,
  - cable TV and radio stations deliver news and entertainment programming to our homes.
  - police keep order,  
25
  - the sanitation department collects refuse, and
  - social services support societal policies for the needy.

These and other important "behind the scenes"  
administrative and support services provide an underlying base or  
foundation that makes the conveniences and necessities of modern  
life as we know it possible and efficient, and allow the wheels of  
5 commerce to spin smoothly.

Suppose you want to buy bread at the local bakery. The  
baker doesn't have to do everything involved in making the bread  
because he can rely on support and administration services the  
community provides. For example:

- 10       • The baker doesn't need to grow or mill grain to make  
          flour for the bread. Instead, he can purchase flour from a  
          supplier that delivers it by truck.
- Similarly, the baker doesn't need to grow or produce fuel  
          to keep its ovens hot; that fuel can be delivered in pipes  
15       or tanks by people who specialize in producing and  
          supplying fuel.
- You can also have confidence in the cleanliness of the  
          local bakery because it displays an inspection notice  
          certifying that it has been inspected by the local health  
20       department.

Support and administrative services are also very important  
to ensure that people are compensated for their efforts. For  
example:

- 25       • You and the bakery can safely trust the government to  
          stand behind the currency you take out of your wallet or  
          purse to pay for the bread.

- If you pay by check, the banking system debits the amount of your check from your bank account overnight and gives the bakery the money.
- 5     • If you and the bakery use different banks, your check may be handled by an automated "clearinghouse" system that allows different banks to exchange checks and settle accounts -- efficiently transferring money between the banks and returning checks drawn on accounts that don't have enough money in them.
- 10    • If the bakery accepts credit cards as payment, the flexibility of payment methods accepted in exchange for the bakery products is increased and provides increased convenience and purchasing power to its customers.

Such support and administrative services provide great

15   economies in terms of scale and scope – making our economy much more efficient. For example, these important support and administrative services allow the baker to concentrate on what he knows how to do best – make and bake bread. It is much more efficient for a bakery and its experienced bakers to make many

20   loaves of bread in its large commercial ovens than it is for individual families to each bake individual loaves in their own home ovens, or for the growers of grain to also bake the bread and pump the fuel needed for baking and accept barter, for example, chickens in exchange for the bread. As a result, you and the

25   bakery can complete your purchasing transaction with a credit card because both you and the bakery have confidence that such a payment system works well and can be trusted to “automatically”

function as a highly efficient and convenient basis for non-cash transactions.

**The Electronic Community Needs Administrative and Support Services**

5           There is now a worldwide electronic community. Electronic community participants need the ability to shape, control, and, in an electronic world, automate, their interactions. They badly need reliable, secure, trusted support and administrative services.

10           More and more of the world's commerce is being carried on electronically. The Internet -- a massive electronic network of networks that connects millions of computers worldwide -- is being used increasingly as the vehicle for commerce transactions. Fueled largely by easy-to-use interfaces (e.g., those allowing customers to "point and click" on items to initiate purchase and  
15 then to complete a simple form to convey credit card information), the Internet is rapidly becoming a focal point for consumer and business to business purchases. It is also becoming a significant "channel" for the sale and distribution of all kinds of electronic properties and services, including information, software, games,  
20 and entertainment.

          At the same time, large companies use both private and public data networks to connect with their suppliers and customers. Driven by apparently inexorable declines in the cost of both computing power and network capacity, electronic commerce  
25 will increase in importance as the world becomes more and more computerized. This new electronic community -- with its widespread electronic commerce -- is generating great new

demands for electronic administrative, support and "clearing" services.

The electronic community badly needs a foundation that will support both commercial and personal electronic interactions and relationships. Electronic commerce on any significant scale will require a dependable, efficient, scaleable, and secure network of third party support and administrative service providers and mechanisms to facilitate important parts of the transaction process.

For example:

- 10           • People who provide value to the electronic community require seamless and efficient mechanisms allowing them to be compensated for the value they provide.
- Providers who sell goods or services to the electronic community need reliable, efficient electronic payment mechanisms to service themselves and other value chain participants.
- 15           • Purchasers in the electronic marketplace, while often unaware of the behind-the-scenes intricacies of payment transaction activity, nonetheless require easy to use, efficient and flexible interfaces to payment mechanisms and financial obligation fulfillment systems.
- 20           • Rights holders in all types of electronic "content" (for example, analog or digital information representing text, graphics, movies, animation, images, video, digital linear motion pictures, sound and sound recordings, still
- 25           images, software computer programs, data), and to many types of electronic control processes, require secure,

flexible and widely interoperable mechanisms for managing their rights and administering their business models, including collecting, when desired, payments and relevant usage information for various uses of their content.

- All parties require infrastructure support services that remain dependable, trusted, and secure even as the volume of commerce transactions increases substantially.

An important cornerstone of successful electronic transaction management and commerce is therefore the development and operation of a set of administrative and support services that support these objectives and facilitate the emergence of more diverse, flexible, scaleable, and efficient business models for electronic commerce generally.

**The Ginter Patent Specification Describes a Comprehensive Solution**

The above-referenced Ginter, et al. patent specification describes technology providing unique, powerful capabilities instrumental to the development of secure, distributed transaction-based electronic commerce and rights management. This technology can enable many important, new business models and business practices on the part of electronic commerce participants while also supporting existing business models and practices.

The Ginter et al. specification describes comprehensive overall systems and wide arrays of methods, techniques, structures and arrangements that enable secure, efficient distributed

electronic commerce and rights management on the Internet (and Intranets), within companies large and small, in the living room, and in the home office. Such techniques, systems and arrangements bring about an unparalleled degree of security,  
5 reliability, efficiency and flexibility to electronic commerce and electronic rights management.

The Ginter, et al. patent specification also describes an “Information Utility” – a network of support and administrative services, facilities and installations that grease the wheels of  
10 electronic commerce and support electronic transactions in this new electronic community. For example, Ginter, et al. details a wide array of support and administrative service providers for interfacing with and supporting a secure “Virtual Distribution Environment.” These support and administrative service  
15 providers include:

- transaction processors,
- usage analysts,
- report receivers,
- report creators,
- 20 • system administrators,
- permissioning agents,
- certification authority
- content and message repositories,

- financial clearinghouses,
- consumer/author registration systems,
- template libraries,
- control structure libraries,
- 5      • disbursement systems,
- electronic funds transfer, credit card, paper billing systems, and
- receipt, response, transaction and analysis audit systems.

10    **The Present Inventions Build On and Extend the Solutions Described In the Ginter Patent Specification**

          The present inventions build on the fundamental concepts described in the Ginter, et al. patent specification while extending those inventions to provide further increases in efficiency,

15    flexibility and capability. They provide an overlay of distributed electronic administrative and support services (the "Distributed Commerce Utility"). They can, in their preferred embodiments, use and take advantage of the "Virtual Distribution Environment" (and other capabilities described in the Ginter et al patent

20    specification and may be layered on top of and expand on those capabilities.

**Brief Summary of Some of the Features and Advantages of the Present Inventions**

The present inventions provide an integrated, modular array of administrative and support services for electronic commerce  
5 and electronic rights and transaction management. These administrative and support services supply a secure foundation for conducting financial management, rights management, certificate authority, rules clearing, usage clearing, secure directory services, and other transaction related capabilities functioning over a vast  
10 electronic network such as the Internet and/or over organization internal Intranets, or even in-home networks of electronic appliances.

These administrative and support services can be adapted to the specific needs of electronic commerce value chains.  
15 Electronic commerce participants can use these administrative and support services to support their interests, and can shape and reuse these services in response to competitive business realities.

The present inventions provide a "Distributed Commerce Utility" having a secure, programmable, distributed architecture  
20 that provides administrative and support services. The Distributed Commerce Utility can make optimally efficient use of commerce administration resources, and can scale in a practical fashion to accommodate the demands of electronic commerce growth.

The Distributed Commerce Utility may comprise a number  
25 of Commerce Utility Systems. These Commerce Utility Systems provide a web of infrastructure support available to, and reusable

by, the entire electronic community and/or many or all of its participants.

Different support functions can be collected together in hierarchical and/or in networked relationships to suit various business models and/or other objectives. Modular support functions can be combined in different arrays to form different Commerce Utility Systems for different design implementations and purposes. These Commerce Utility Systems can be distributed across a large number of electronic appliances with varying degrees of distribution.

The comprehensive "Distributed Commerce Utility" provided by the present invention:

- Enables practical and efficient electronic commerce and rights management.
- Provides services that securely administer and support electronic interactions and consequences.
- Provides infrastructure for electronic commerce and other forms of human electronic interaction and relationships.
- Optimally applies the efficiencies of modern distributed computing and networking.
- Provides electronic automation and distributed processing.
- Supports electronic commerce and communications infrastructure that is modular, programmable, distributed and optimally computerized.

- Provides a comprehensive array of capabilities that can be combined to support services that perform various administrative and support roles.
- 5 • Maximizes benefits from electronic automation and distributed processing to produce optimal allocation and use of resources across a system or network.
- Is efficient, flexible, cost effective, configurable, reusable, modifiable, and generalizable.
- 10 • Can economically reflect users' business and privacy requirements.
- Can optimally distribute processes -- allowing commerce models to be flexible, scaled to demand and to match user requirements.
- 15 • Can efficiently handle a full range of activities and service volumes.
- Can be fashioned and operated for each business model, as a mixture of distributed and centralized processes.
- Provides a blend of local, centralized and networked capabilities that can be uniquely shaped and reshaped to meet changing conditions.
- 20 • Supports general purpose resources and is reusable for many different models; in place infrastructure can be reused by different value chains having different requirements.
- 25 • Can support any number of commerce and communications models.

- Efficiently applies local, centralized and networked resources to match each value chain's requirements.
- Sharing of common resources spreads out costs and maximizes efficiency.
- 5     • Supports mixed, distributed, peer-to-peer and centralized networked capabilities.
- Can operate locally, remotely and/or centrally.
- Can operate synchronously, asynchronously, or support both modes of operation.
- 10    • Adapts easily and flexibly to the rapidly changing sea of commercial opportunities, relationships and constraints of "Cyberspace."

In sum, the Distributed Commerce Utility provides comprehensive, integrated administrative and support services for  
15   secure electronic commerce and other forms of electronic interaction.

Some of the advantageous features and characteristics of the Distributed Commerce Utility provided by the present inventions include the following:

- 20     • The Distributed Commerce Utility supports programmable, distributed, and optimally computerized commerce and communications administration. It uniquely provides an array of services that perform various administrative and support roles -- providing the  
25     administrative overlay necessary for realizing maximum benefits from electronic automation, distributed

processing, and system (e.g., network) wide optimal resource utilization.

- 5           • The Distributed Commerce Utility is particularly adapted to provide the administrative foundation for the Internet, organization Intranets, and similar environments involving distributed digital information creators, users, and service systems.
- 10          • The Distributed Commerce Utility architecture provides an efficient, cost effective, flexible, configurable, reusable, and generalizable foundation for electronic commerce and communications administrative and support services. Providing these capabilities is critical to establishing a foundation for human electronic interaction that supports optimal electronic relationship models -- both commercial and personal.
- 15           • The Distributed Commerce Utility architecture provides an electronic commerce and communication support services foundation that can be, for any specific model, fashioned and operated as a mixture of distributed and centralized processes.
- 20           • The Distributed Commerce Utility supported models can be uniquely shaped and reshaped to progressively reflect optimal blends of local, centralized, and networked Distributed Commerce Utility administrative capabilities.
- 25           • The Distributed Commerce Utility supported models can be uniquely shaped and reshaped to progressively reflect optimal blends of local, centralized, and networked Distributed Commerce Utility administrative capabilities.

- The Distributed Commerce Utility's innovative electronic administrative capabilities support mixed, distributed, peer-to-peer and centralized networked capabilities. Collections of these capabilities, can each operate in any mixture of local, remote, and central asynchronous and/or synchronous networked combinations that together comprise the most commercially implementable, economic, and marketable -- that is commercially desirable -- model for a given purpose at any given time.
- The Distributed Commerce Utility architecture is general purpose. It can support any number of commerce and communication models which share (e.g., reuse), as appropriate, local, centralized, and networked resources. As a result, the Distributed Commerce Utility optimally enables practical and efficient electronic commerce and rights management models that can amortize resource maintenance costs through common usage of the same, or overlapping, resource base.
- One or more Distributed Commerce Utility commerce models may share some or all of the resources of one or more other models. One or more models may shift the mix and nature of their distributed administrative operations to adapt to the demands of Cyberspace -- a

rapidly changing sea of commercial opportunities,  
relationships, and constraints.

- 5                   • The Distributed Commerce Utility supports the  
                    processes of traditional commerce by allowing their  
                    translation into electronic commerce processes. The  
                    Distributed Commerce Utility further enhances these  
                    processes through its use of distributed processing,  
                    rights related “clearinghouse” administration, security  
                    designs, object oriented design, administrative smart  
10                 agents, negotiation and electronic decision making  
                    techniques, and/or electronic automation control  
                    techniques as may be necessary for efficient,  
                    commercially practical electronic commerce models.
- 15               • Certain Distributed Commerce Utility operations  
                    (financial payment, usage auditing, etc.) can be  
                    performed within participant user electronic appliance  
                    secure execution spaces such as, for example,  
                    “protected processing environments” disclosed in  
                    Ginter et al.
- 20               • Distributed clearinghouse operations may be  
                    performed through “virtually networked and/or  
                    hierarchical” arrays of Commerce Utility System sites  
                    employing a general purpose, interoperable (e.g.,  
                    peer-to-peer) virtual distribution environment  
25               foundation.

- For a given application or model, differing arrays of Distributed Commerce Utility Services may be authorized to provide differing kinds of administrative and/or support functions.
- 5 • Any or all of the roles supported by the Distributed Commerce Utility may be performed by, and/or used by, the same organization, consortium or other grouping of organizations, or other electronic community participants, such as individual user web  
10 sites.
- One or more parts of the Distributed Commerce Utility may be comprised of a network of distributed protected processing environments performing one or more roles having hierarchical and/or peer-to-peer  
15 relationships.
- Multiple Distributed Commerce Utility protected processing environments may contribute to the overall role of a service, foundation component, and/or clearinghouse.
- 20 • Distributed protected processing environments contributing to a Distributed Commerce Utility role may be as distributed, in a preferred embodiment, as the number of VDE participant protected processing environments and/or may have specific hierarchical,  
25 networked and/or centralized administration and

support relationship(s) to such participant protected processing environments.

- 5                   • In a given model, certain one or more Distributed Commerce Utility roles may be fully distributed, certain other one or more roles may be more (e.g., hierarchically), and/or fully, centralized, and certain other roles can be partially distributed and partially centralized.
- 10               • The fundamental peer-to-peer control capabilities provided by the Distributed Commerce Utility allows for any composition of distributed roles that collectively provide important, practical, scaleable, and/or essential commerce administration, security, and automation services.
- 15               • Combinations of Distributed Commerce Utility features, arrangements, and/or capabilities can be employed in programmable mixtures of distributed and centralized arrangements, with various of such features, arrangements, and capabilities operating in  
20               end-user protected processing environments and/or “middle” foundation protected processing environments (local, regional, class specific, etc.) and/or centralized service protected processing environments.

- The Distributed Commerce Utility is especially useful to support the Internet and other electronic environments that have distributed information creators, users and service providers. By helping people to move their activities into the electronic world, it plays a fundamentally important role in migration of these non-electronic human activities onto the Internet, Intranets, and other electronic interaction networks. Such network users require the Distributed Commerce Utility foundation and support services in order to economically realize their business and privacy requirements. This secure distributed processing foundation is needed to optimally support the capacity of electronic commerce models to meaningfully scale to demand and efficiently handle the full range of desired activities and service volume.
- The Distributed Commerce Utility technologies provided by the present inventions provide a set of secure, distributed support and administrative services for electronic commerce, rights management, and distributed computing and process control.
- The Distributed Commerce Utility support services including highly secure and sophisticated technical and/or contractual services, may be invoked by electronic commerce and value chain participants in a

seamless, convenient, and relatively transparent way that shields users against the underlying complexity of their operation.

- 5                   • The Distributed Commerce Utility can ensure appropriately high levels of physical, computer, network, process and policy-based security and automation while providing enhanced, efficient, reliable, easy to use, convenient functionality that is necessary (or at least highly desirable) for orderly and  
10                   efficiently supporting of the needs of the electronic community.
- 15                  • The Distributed Commerce Utility, in its preferred embodiments, support the creation of competitive commercial models operating in the context of an “open” VDE based digital marketplace.
- 20                  • The Distributed Commerce Utility can provide convenience and operating efficiencies to their value chain participants. For example, they may offer a complete, integrated set of important “clearing”  
25                   function capabilities that are programmable and can be shaped to optimally support multi-party business relationship through one seamless, “distributed” interface (e.g., a distributed application). Clearing and/or support functions and/or sub-functions can, as desirable, be made available individually and/or

separately so as to serve business, confidentiality, efficiency, or other objectives.

- 5                   • The Distributed Commerce Utility can make it easy for providers, merchants, distributors, repurposers, consumers, and other value chain participants to attach to, invoke, and work with Distributed Commerce Utility services. Hookups can be easy, seamless and comprehensive (one hook-up may provide a wide variety of complementary services).
- 10               • The Distributed Commerce Utility can further enhance convenience and efficiency by providing or otherwise supporting consumer brand images for clearing services offered by participant organizations, but utilizing shared infrastructure and processes.
- 15               • The Distributed Commerce Utility can realize important efficiencies resulting from scale and specialization by participant organizations by supporting “virtual” models that electronically and seamlessly employ the special services and
- 20               capabilities of multiple parties.
- 25               • The Distributed Commerce Utility makes it possible for consumers to conveniently receive a benefit such as a service or product, where such service or product results from the invocation of a “fabric” of various support services -- each of which service may be

comprised of a distributed fabric of more specialized services and/or participating constituent service providers (the overall fabric is apparent to the value chain participant, the underlying complexity is (or can be) largely or entirely hidden).

- Distributed Commerce Utility services and capabilities in their preferred embodiments can employ and be combined in any reasonable manner with any one or more Virtual Distribution Environment capabilities described in Ginter, et. al., including for example:

- A. VDE chain of handling and control,
- B. secure, trusted internodal communication and interoperability,
- C. secure database,
- D. authentication,
- E. cryptographic,
- F. fingerprinting,
- G. other VDE security techniques,
- H. rights operating system,
- I. object design and secure container techniques,
- J. container control structures,
- K. rights and process control language,
- L. electronic negotiation,
- M. secure hardware, and

5 N. smart agent (smart object) techniques (for example, smart agents employed as process control, multi-party, and/or other administrative agent capabilities supporting distributed node administrative integration).

### **Commerce Utility Systems Can Be Distributed and Combined**

10 The support and administrative service functions provided by the Distributed Commerce Utility can be combined in various ways and/or distributed through an electronic community, system or network. The preferred embodiment uses the protected processing environment based Virtual Distribution Environment described in Ginter et al. to facilitate such combinations and distributedness. Since all such Virtual Distribution Environment  
15 protected processing environments are at least to some degree trusted, every protected processing environment can be a clearinghouse or a part of a clearinghouse. Commerce models acceptable to the interest and desires of VDE commerce node users, can support Distributed Commerce Utility services that are  
20 pushed all the way to end-user electronic appliances employing, for example, other VDE protected processing environments, secure communication techniques and other VDE capabilities (as discussed elsewhere VDE capabilities can be directly integrated with the present inventions). Such appliances, along with more  
25 centralized value chain nodes can together form combinations that function as virtual clearing protected processing environments. In

the end, cyberspace will be populated, in part, by big, "virtual" computers where access to resources is based upon "availability" and rights.

- The Distributed Commerce Utility is a modular,
- 5 programmable and generalizable context that it can support such virtual computers. The Distributed Commerce Utility is a unique architectural foundation for the design of electronic commerce value chain models and virtual computers. The programmable nature of a particular implementation can support differing actual
- 10 (logical and/or physical), and/or degrees of, distribution for the same and/or similar services For example:
- Centralized Commerce Utility Systems and services may be used to provide certain support service functions, or collections of functions, efficiently from a centralized

15 location.

  - Other Commerce Utility Systems might be provided in a partially or wholly distributed manner.
  - Some support and administrative service functions might be distributed in and/or throughout existing or new

20 communications infrastructure or other electronic network support components.

  - Other support services might operate within secure execution spaces (e.g., protected processing environments) on any or all user electronic appliances,

25 using peer-to-peer communications and interactions, for example, to provide a secure web of support service fabric.

- Other support services might operate both in the network support infrastructure and at user electronic appliances.

Such distributed support services may complement (and/or eliminate the need for) more centralized support service

5 installations. Different combinations of the same and/or differing, non-distributed and differently distributed services may be provided to support different activities. Moreover, the nature and distribution of services for one overall model may differ from one implementation to another. Such differing model implementations  
10 can, if desired, share both the same Commerce Utility Systems and Services and/or any particular and/or any combination of Distributed Commerce Utility administrative and/or support functions.

Further, a particular Commerce Utility Systems and Service  
15 infrastructure may be used by differing value chains (e.g., business model or relationship set) in differing manners. For example, certain value chains may elect to keep certain support service functions more centralized for efficiency, security, control or other reasons, others may elect more and/or differently distributed  
20 models.

Provided that, for example, payment methods and rightsholders and/or other value chain participants concur, any one or more of the Distributed Commerce Utility secure infrastructure support services may distribute and/or delegate a portion or all of  
25 their functions and authority to any arbitrary collection or set of end-user and/or other value chain electronic appliances. Distributing and delegating these services and functions has

various advantages including, for example, enabling flexible and efficient creation of temporary, *ad hoc* webs of secure electronic commerce in which any, a number, or all appliance(s) in the collection or set may participate as at least a partial (if not full)

5 peer of other appliances in the same commerce web fabric.

The present invention provides the following non-exhaustive list of additional features relating to distributing administrative and support functions:

- 10 • Any mixture of any administrative and/or support functions may be integrated with any other mixture of administrative and/or support functions.
- Any set or subset of Commerce Utility System functions can be combined in an integrated design with any other mixture of Commerce Utility system functions. Such  
15 mixtures can be distributed to any desired degree and any one or more portions of the mixture may be more or less distributed than any other one or more portion. This allows a value chain to employ optimum desired and/or practical designs. Any mixture, including any degrees of  
20 distribution, of rights clearing, financial clearing, usage aggregation, usage reporting and/or other clearing and/or other Distributed Commerce Utility functions, can be provided. Such Distributed Commerce Utility functions and/or administrative and/or support services can be  
25 combined with any other desired Distributed Commerce Utility functions and/or administrative and/or support services.

- Any one or more such administrative and/or support services and/or functions can operate as a Commerce Utility System and support a web of Commerce Utility System nodes, each of which supports at least a portion of such Commerce Utility administrative service activities. Each Commerce Utility System may be capable of granting authority and/or providing services to and/or otherwise securely interoperating with other Commerce Utility Systems and/or nodes.
- Each Commerce Utility System (or combination of Commerce Utility Systems) may be capable of participating as a “virtual clearinghouse” comprised of plural Commerce Utility Systems. In the preferred embodiment, these “virtual clearinghouses” may, when in accordance with VDE rules and controls, interoperate -- in a fashion prescribed by such rules and controls -- with other Commerce Utility Systems and/or other virtual clearinghouses participating in the same web. Such “virtual clearinghouses” may receive authority from secure chain of handling and control embodied in electronic control sets, and may participate in electronic commerce process automation resulting from such chain of handling and control and other VDE capabilities.

This ability to distribute, and, if desired to subsequently adapt (modify), any support service functions to any desired degree across a system or network provides great power, flexibility and increases in efficiency. For example, distributing

aspects of support services such as clearing functions will help avoid the "bottlenecks" that a centralized clearing facility would create if it had insufficient capacity to handle the processing loads.

Taking advantage of the distributed processing power of many value chain participant appliances also has great benefits in terms of improved effectiveness and system response time, much lower overhead of operation, greater fault tolerance, versatility in application implementations, and, in general much greater value chain appeal resulting from the present inventions adaptability to each value chain participant's needs and requirements.

**Some Examples of Administrative and/or Support Services Provided by the Distributed Commerce Utility**

The Distributed Commerce Utility may be organized into a number of different, special and/or general purpose "Commerce Utility Systems." The Commerce Utility Systems can be centralized, distributed, or partially distributed and partially centralized to provide administrative, security, and other services that practical commerce management layer requires. Certain Commerce Utility Systems comprise Distributed Commerce Utility implementations of certain well known administrative service functions, such as financial clearinghouse and certifying authorities. Other Commerce Utility Systems involve new forms of services and new combinations and designs for well known service activities. A Commerce Utility System is any instantiation of the Distributed Commerce Utility supporting a specific electronic commerce model, and a Commerce Utility System may itself be comprised of constituent Commerce Utility

Systems. Commerce Utility Systems may include any or all of the following, in any combination of capabilities and distribution designs, for example:

- financial clearinghouses,
- 5       • usage clearinghouses,
- rights and permissions clearinghouses,
- certifying authorities,
- secure directory services,
- secure transaction authorities,
- 10       • multi-purpose, general purpose and/or combination Commerce Utility Systems including any combination of the capabilities of the systems listed immediately above, and
- other Commerce Utility Systems.

15       These Commerce Utility Systems are far-reaching in their utility and applicability. For example they may provide administrative support for any or all of the following:

- trusted electronic event management,
- networked, automated, distributed, secure process
- 20       administration and control,
- Virtual Distribution Environment chain-of-handling and control, and
- rights administration and usage (e.g., event) management

(e.g., auditing, control, rights fulfillment, etc.), across and/or within electronic networks, including “unconnected,” virtually connected, or periodically connected networks.

- 5       The Commerce Utility Systems may govern electronic process chains and electronic event consequences related to, for example:
- electronic advertising,
  - market and usage analysis,
  - electronic currency,
  - 10       • financial transaction clearing and communications,
  - manufacturing and other distributed process control models,
  - financial clearing,
  - enabling payment fulfillment or provision of other
  - 15       consideration (including service fees, product fees or any other fees and/or charges) based at least in part on content, process control (event) and/or rights management,
  - performing audit, billing, payment fulfillment (or
  - 20       provision of other consideration) and/or other clearing activities,
  - compiling, aggregating, using and/or providing information relating to use of one or more secure containers and/or content and/or processes (events),
  - 25       including contents of secure containers and/or any other content,
  - providing information based upon usage auditing, user

profiling, and/or market surveying related to use of one or more secure containers and/or content and/or processes (events),

5

- employing information derived from user exposure to content (including advertising) and/or use of processes (events),

10

- providing object registry services; and/or rights, permissions, prices, and/or other rules and controls information; for registered and/or registering objects;
- electronically certifying information used with and/or required by rules and controls, such as authenticating identity, class membership and/or other attributes of identity context including for example, certification of class identity for automating processes, such as rights related financial transaction fulfillment based upon governing jurisdiction (taxation(s)), employment and/or other group membership including, for example, acquired class rights (e.g., purchased discount buyers club membership);

15

20

- third party archiving and/or authenticating of transactions and/or transaction information for secure backup and non-repudiation,
- providing programmed mixed arrays of Commerce Utility System process control and automation services, where different Commerce Utility Systems support different value chains and/or business models requirements, and where such Commerce Utility

25

- Systems further support distributed, scalable, efficient networked and/or hierarchical fixed and/or virtual clearinghouse models which employ secure communication among a Commerce Utility System's distributed clearinghouse protected processing environments for passing clearinghouse related rules and controls and derived, summarized, and/or detailed transaction information,
- EDI, electronic trading models, and distributed computing arrangements where participants require trusted foundation that enables efficient, distributed administration, automation, and control of transaction value chains, and
  - other support and/or administrative services and/or functions.

### BRIEF DESCRIPTION OF THE DRAWINGS

These and other features and advantages provided by the present inventions will become better and more completely understood by studying the following detailed description of presently preferred example embodiments in conjunction with the drawings, of which:

- Figure 1 shows an example Distributed Commerce Utility supporting a consumer's example electronic appliance;
- Figure 1A shows a protected processing environment(s) ("PPE") within the consumer's electronic appliance(s);

Figure 1B shows that the Distributed Commerce Utility may comprise a number of example Commerce Utility Systems;

Figures 2A-2E show examples of how administrative and support service functions can be distributed;

5        Figures 3A-3C show example distributed Commerce Utility Systems;

Figure 4 shows an example web of Commerce Utility Systems;

10       Figure 4A shows a limitless web of consumer appliances and Commerce Utility Systems;

Figure 5 shows how rights holders can select between multiple Commerce Utility Systems connected to an electronic “information highway”;

## **DETAILED DESCRIPTION OF EXAMPLE EMBODIMENTS**

### **Distributed Commerce Utility**

5           Figure 1 shows an example consumer appliance 100 electronically connected to Distributed Commerce Utility 75. In this example, an electronic network 150 connects appliance 100 to Distributed Commerce Utility 75. Distributed Commerce Utility 75 supports the activities going on within consumer appliance  
10   100.

          Distributed Commerce Utility 75 provides a foundation of administrative and support services for electronic commerce and communications. This foundation is efficient, cost effective, flexible, configurable, reusable, programmable and generalizable.  
15   It supports all kinds of electronic relationships, interactions and communications for both personal and business use.

### **The Distributed Commerce Utility Can Support Any Electronic Appliance**

          Appliance 100 may be any sort of electrical or electronic  
20   device such as for example, a computer, an entertainment system, a television set, or a video player – just to name a few examples. In the particular example shown in Figure 1, the consumer appliance 100 is a home color television set 102, a video player/recorder 104, and a set top box 106. Appliance 100 may be  
25   controlled by hand held remote controller 108, for example. Set top box 106 could receive television programs from television

broadcasters 110 and/or satellites 112 via a cable television network 114, for example. Player/recorder 104 could play various types of program material from tapes, optical disks or other media, and may also have the capability of recording program materials received through set top box 106.

**The Appliance 100 Can Have A "Protected Processing Environment"**

Appliance 100 preferably is a secure electronic appliance of the type shown for example in Figures 7 and 8 of the Ginter et al. patent specification. It is preferably part of the "Virtual Distribution Environment" described in the Ginter, et al. patent specification. Figure 1A shows that television 102, set top box 106, media player/recorder 104 and remote control 108 may each have a "protected processing environment" ("PPE") 154. Distributed Commerce Utility 75 may interact with and support the processes going on within each of these protected processing environments 154.

Protected processing environments 154 may be based on one or more computer chips, such as a hardware and/or software based "secure processing unit" as shown in Figure 9 of the Ginter et al. Patent specification. The protected processing environment 154 provides a highly secure, trusted environment in which electronic processes and transactions can be reliably performed without significant danger of tampering or other compromise. The Ginter et al. patent disclosure describes techniques, systems and methods for designing, constructing and maintaining the protected processing environment 154 so that rights holders and other value

chain participants (including consumers 95) can trust its security and integrity. In the preferred embodiment, this trustedness is important in the interaction between the Distributed Commerce Utility 75 and electronic appliance 100.

5     **The Distributed Commerce Utility Can be Made Up of Many "Commerce Utility Systems"**

Figure 1B shows that Distributed Commerce Utility 75 can be made up of a number of Commerce Utility Systems 90. There can be different kinds of Commerce Utility Systems, for example:

- 10             •     a financial clearinghouse 200;
- a usage clearinghouse 300;
- a rights and permissions clearinghouse 400;
- a certifying authority 500;
- a secure directory services 600;
- 15             •     a transaction authority 700;
- a VDE administrator 800; and
- other kinds of Commerce Utility Systems 90.

Commerce Utility Systems 90 can support and administer functions or operations within protected processing

20    environment(s) 154. For example:

- The appliance 100 protected processing environment 154 may provide an automatic electronic payment mechanism 118 that debits the consumers' bank or other money account based on program consumption.
- 25             Distributed Commerce Utility 75 may include a

special purpose Commerce Utility System 90a called  
a "financial clearinghouse" 200 that supports  
financial aspects of the operation of the protected  
processing environment 154 -- ensuring that rights  
holders and others get paid appropriate amounts and  
that the consumers 95 are not charged excessive  
amounts.

- The broadcaster of a television program 102a may  
require appliance 100's protected processing  
environment 154 to meter, with an electronic usage  
metering mechanism 116, how much of video  
program 102a the consumers 95 watch, and which  
video programs they watch. Distributed Commerce  
Utility 75 may include a special purpose Commerce  
Utility System 90b called a "usage clearinghouse"  
300 that receives usage information metered by a  
usage meter 116 within the protected processing  
environment 154, analyzes it and provides reports.
- The rights holders in video program 102a may insist  
upon the protected processing environment 154  
providing a copy protection mechanism 120 that  
securely protects against copying video program  
102a. Distributed Commerce Utility 75 may include  
a special purpose Commerce Utility System 90c  
called a "rights and permissions clearinghouse" 400  
that supplies the protected processing environment

154 with necessary permissions to allow consumers  
95 to watch particular programs (for example, on a  
pay per view basis) and to assist in enforcing  
prohibitions, such as, for example, a copy protection  
mechanism 120.

5

- Rights holders in video program 102a may further  
require the appliance 100 protected processing  
environment 154 to possess a “digital certificate” 122  
certifying the consumer’s identity, age, or the like  
before consumers 95 can watch video program 102a.  
Distributed Commerce Utility 75 may include a  
special purpose Commerce Utility System 90d called  
a “certifying authority” 500 that creates and provides  
“digital certificates” 504 to the protected processing  
environment 154 -- allowing the consumers to  
efficiently interact with the permissions provided by  
the rights holders.

10

15

Other Commerce Utility Systems 90 shown in Figure 1B  
include:

20

- A “Secure directory services” 600 that may assist the  
protected processing environment 154 in  
communicating electronically with other computers  
and appliances over network 150;
- A “transaction authority” 700 that may be available  
for process control and automation such as, for  
example, securely auditing and overseeing

25

complicated electronic transactions involving  
protected processing environment 154; and

- A virtual distribution environment ("VDE")  
"administrator" 800 that may, in the preferred  
embodiment, keep the protected processing  
environment 154 operating smoothly and securely.

Still other Commerce Utility Systems 90 not shown in  
Figure 1B may be used to administer and/or support additional  
functions and operations. The various Commerce Utility Systems  
90 can work together, dividing up the overall tasks to support the  
consumers 95 efficiently and effectively.

#### **Commerce Utility Systems Can Be Distributed**

Figures 2A-2E show how Distributed Commerce Utility 75  
can be distributed. Some administrative and support functions of  
Commerce Utility Systems 90 can be performed within a  
consumer's electronic appliance 100 – or even in a "spread out"  
fashion over a large number of different appliances cooperating  
together.

As described above, appliances 100 each provide a  
protected processing environment 154 that is tamper resistant and  
provides a secure place in which administrative and support  
operations can be performed. This allows an electronic appliance  
100 within a consumer's home to perform operations that can  
be trusted by other parties, such as rights holders, electronic  
commerce participants, and the like. Because of the trusted,  
protected characteristics of protected processing environment 154,

the parts, extensions or even the entirety of a Commerce Utility System 90 may exist within each or any of the protected processing environments 154 and associated electronic appliances within the overall system.

5        Figures 2A-2E represent the overall functions of an example Commerce Utility System 90 such as Usage Clearinghouse 300 as a four-piece jigsaw puzzle. Figures 2A-2E show that these Commerce Utility System functions can be distributed to varying degrees. For example:

- 10        • Figure 2A shows an example in which all functions of the Commerce Utility System 90 are performed in a secure central facility.
- Figure 2B shows an example in which most functions of the Commerce Utility System 90 are performed in a  
15        secure central facility, but some of its functions are performed within the protected processing environment 154 of a user electronic appliance 100.
- Figure 2C shows an example in which some functions of the Commerce Utility System 90 are performed in a  
20        secure central facility, but most of its functions are performed within the protected processing environment 154 of a user electronic appliance 100.
- Figure 2D shows an example in which some functions of the Commerce Utility System 90 are performed in a  
25        secure central facility, some of its functions are performed within the protected processing environment 154A of a first user electronic appliance 100A, and some

of its functions are performed within the protected processing environment 154B of a second user electronic appliance 100B.

- Figure 2E shows an example in which none of the functions of the Commerce Utility System 90 are performed in a secure central facility; some of its functions are performed within the protected processing environment 154(1) of a first user electronic appliance 100(1), some of its functions are performed within the protected processing environment 154(2) of a second user electronic appliance 100(2), ), some of its functions are performed within the protected processing environment 154(3) of a third user electronic appliance 100(3), and some of its functions are performed within the protected processing environment 154(N) of a Nth user electronic appliance 100(N).

Alternately or in addition, some of the functions of the Commerce Utility System 90 may be distributed within network 150 – for example, in the equipment used to communicate data between appliances 100.

#### **Distributing Multiple Administrative and Support Functions**

Figure 3A shows how multiple Commerce Utility System 90 functions or sub-functions can be distributed into the same protected processing environment 154.

For example:

- Financial clearinghouse function 200a operating within consumer appliance 100A's protected processing environment 154a may provide certain financial clearing such as auditing that can take the place of and/or support some of the financial clearing operations performed by a centralized financial clearinghouse 200.
  - Usage clearinghouse function 300a operating within consumer appliance 100A's protected processing environment 154a may perform certain usage information clearing operations, such as, for example, combining or analyzing collected usage information to complement, substitute for, or add to usage clearing operations performed by usage clearinghouse 300.
  - Appliance 100A's protected processing environment 154a may perform certain rights and permissions clearing operations 400a, certain certifying authority operations 500a, and certain secure directory services support operations 600a all at the consumer's site to complement, add to or substitute for operations performed by rights and permissions clearinghouse 400, certifying authority 500 and secure directory services 600.
- Figure 3B shows that another example consumer electronic appliances 100(2),..., 100N (in this case personal computers 124)

might perform different combinations of support or administrative functions locally (for example, some or all of the functions performed by transaction authority 700). For example:

- 5           • the processes within protected processing environment  
154(1) may rely on a partially distributed and partially centralized financial clearinghouse 200A, a partially distributed and partially centralized usage clearinghouse 300A, a partially distributed and partially centralized rights and permissions clearinghouse 400A, a partially distributed and partially centralized certifying authority 500A, a centralized secure directory services 600A, and a centralized transaction authority 700A;
- 10          • the processes within protected processing environment  
154(2) may rely on a centralized financial clearinghouse 200B, a partially distributed and partially centralized usage clearinghouse 300B, a partially distributed and partially centralized rights and permissions clearinghouse 400B, a centralized certifying authority 500B, a centralized secure directory services 600B, and a  
20          partially distributed and partially centralized transaction authority 700B; and
- 25          • the processes within protected processing environment  
154(N) may rely on a partially distributed and partially centralized financial clearinghouse 200N, a partially distributed and partially centralized usage clearinghouse 300N, a partially distributed and partially centralized rights and permissions clearinghouse 400N, a partially

distributed and partially centralized certifying authority  
500N, a partially distributed and partially centralized  
secure directory services 600N, and a partially  
distributed and partially centralized transaction authority  
5 700N.

Taking this concept of distributed clearing services further,  
it would be possible to completely distribute the Distributed  
Commerce Utility 75 as shown in Figure 3C – relying mostly or  
completely on administrative and support service operations and  
10 activities within the secure, protected processing environments  
154 of users' electronic appliances 100. Thus, the users' own  
electronic appliances 100 could – in a distributed manner --  
perform any or all of financial, usage, and rights and permissions  
clearing, as well as certification, secure directory services and  
15 transaction authority services. Such "local" and/or parallel and/or  
distributed processing transaction clearing might more efficiently  
accommodate the needs of individual consumers. For example,  
this is one way of allowing consumers to contribute controls that  
prevent certain private data from ever leaving their own electronic  
20 appliance while nevertheless providing rightsholders with the  
summary information they require.

The distributed arrangements shown in Figures 2A-2E and  
3A-3C are not mutually exclusive ways of providing centralized  
Commerce Utility System 90. To the contrary, it may be  
25 advantageous to provide hybrid arrangements in which some  
administrative and support service functions (such as, for example,  
micro-payment aggregation, usage data privacy functions, and

some issuing of certificates, such as parents issuing certificates for their children) are widely distributed while other administrative and support service functions (for example, issuance of important digital certificates, maintaining massive data bases supporting secure directory services, etc.) are much more centralized. The degree of distributedness of any particular administrative and support service, clearinghouse or function may depend on a variety of very important issues including, for example, efficiency, trustedness, scalability, resource requirements, business models, and other factors. In addition, the degree of distribution may involve multiple levels of hierarchy based, for example, on subsets determined by specific business models followed by specific business sub-models, or, for example, geographic and/or governing body and/or region areas.

Since a given electronic appliance 100 can participate in multiple activities, it is possible that its different activities may rely on different blends of distributed and centralized Commerce Utility Systems 90. For example, for one activity a protected processing environment 154 may rely on a centralized financial clearinghouse 200, for another activity it may rely on a partially distributed and partially centralized financial clearinghouse 200, and for still another activity it may rely on a wholly distributed financial clearinghouse 200. Different degrees of distributedness may be used for different activities or business models.

**Web of Commerce Utility Systems**

Figure 4 shows that Commerce Utility System 75 may comprise a vast “web” of distributed, partly distributed and/or centralized Commerce Utility Systems 90. Network 150 can be used to connect this web of Commerce Utility Systems 90 to a variety of different electronic appliances 100 that can all share the Distributed Commerce Utility 75. For example, electronic network 150 can connect to:

- set top boxes 106 and/or media players 104,
- personal computers 124,
- computer graphics workstations 126,
- multi-media/video game systems 128, or
- any other kinds of electronic appliances 100 including for example, manufacturing control device, household appliances, process control equipment, electronic networking and/or other communication infrastructure devices, mainframe and/or mini computers, etc.

In this example, the same Distributed Commerce Utility 75 can support a variety of different kinds of activities of a number of different consumers, authors, distributors, providers, merchants, and other people – and the Distributed Commerce Utility 75 can support a very large variety of different electronic activities.

Figure 4 also shows that Commerce Utility Systems 90 may communicate with electronic appliances 100 (and with each other)

by exchanging electronic “containers” 152 of the type disclosed in Ginter et al. for purposes of security (for example, secrecy, authenticity and integrity) and managed through the use of secure rules and controls processed in protected processing environments.

5    **The Commerce Utility Systems Web Can Be Virtually Limitless**

Figure 4A shows that the web of Commerce Utility Systems may be vast or limitless. Indeed, network 150 may be a seamless web stretching around the world and connecting millions upon  
10    millions of electronic appliances with any number of Commerce Utility Systems 90.

The Commerce Utility Systems 90 web may provide a very complex interconnection with a variety of different types of electronic appliances performing a variety of different electronic  
15    functions and transactions. As mentioned above, any of electronic appliances 100 may be able to communicate with any of the Commerce Utility Systems 90 or with any other electronic appliance. This allows maximum efficiency and flexibility in terms of allocating different Commerce Utility Systems to  
20    different electronic transactions. For example:

- Geographically close Commerce Utility Systems might best be used to minimize the amount of time it takes to get messages back and forth.
- In some cases, more distant Commerce Utility Systems  
25    might be better equipped to efficiently handle certain kinds of specialized transactions.

- Government regulations might also, at least in part, dictate the selection of certain Commerce Utility Systems over others. (for example, a Japanese customer may run into legal problems if she tries to use a financial clearinghouse 200 located in the Cayman Islands – or a New Jersey resident might be required by law to deal with a financial clearinghouse 200 that reports New Jersey sales tax).
- Different, competitive Commerce Utility Systems are likely to be offered by different parties and these different systems would populate the web comprising Distributed Commerce Utility 75. Interoperability between such System and/or their nodes is important for efficiency and to allow reusability of electronic commerce resources.

#### **Rights Holders And Providers Can Choose Among Commerce Utility Systems**

Figure 5 shows how rights holders can select between different Commerce Utility Systems 90. In this example, Bob operates a first usage clearinghouse 300a, Alice operates a second usage clearinghouse 300b, and Helen operates a third usage clearinghouse 300c. These various usage clearing service providers may compete with one another based on quality and/or price, or they may be complementary (for example, they may each specialize in different kinds of transactions).

Because electronic network 150 may connect electronic appliances 100 to many different Commerce Utility Systems 90,

rightsholders in the digital properties the consumers are using may have a number of different Commerce Utility Systems to choose from. Content providers and rights holders may authorize particular (or groups of) Commerce Utility Systems 90 to handle  
5 different aspects of transactions. For example:

- Computer software distributor might specify that a personal computer 124 should send metering information 116a to Helen's usage clearinghouse 300c for monitoring usage of the computer software  
10 or other activities performed by the personal computer.
- A rights holder in video program 102a might specify that set top box 106 should send metering information 116 about the video to Alice's usage clearinghouse.
- 15 • A multimedia content provider might specify that Bob's usage clearinghouse 300a should be used for processing usage data 116c generated by multimedia player 128.

In some instances, particular consumers 95 may also pay a  
20 role in specifying in advance particular clearinghouses or other Commerce Utility Systems 90 they prefer to use. Figure 5 illustrates the provider's (and/or consumer's) choice by a policeman directing metering traffic to selected usage clearinghouses 300 (electronic controls as described herein and in  
25 Ginter et al. would preferably be the mechanism actually controlling how traffic is directed).

A content provider or rights holder could allow a consumer 95 to select from a group of Commerce Utility Systems 90 (and/or Commerce Utility Systems 90 providers) the content provider/rights holder wants to deal with. For example:

- 5           • A television studio might authorize specific individual or classes of Commerce Utility Systems 90 to handle transactions relating to its television programs and/or it may specify particular individual or classes of Commerce Utility Systems 90 that it doesn't want to  
10           have handle its transactions.
- Particular Commerce Utility Systems 90 may set requirements or standards for individual (or classes of) providers and/or consumers 95.
- Value chain participants could enter into legal  
15           agreements and/or business relationships with different Commerce Utility Systems 90.

#### **Commerce Utility Systems Can Work Together**

Figure 6 shows that different Commerce Utility Systems 90 can work together to support different kinds of operations. In this  
20   example:

- Usage clearinghouse 300a, rights and permissions clearinghouse 400a, certifying authority 500a, and financial clearinghouse 200a (left-hand side of drawing) might be used to support a particular  
25           operation by set top box 106 and television set 102.

- The same financial clearinghouse 200a but a different usage clearinghouse 300b, a different certifying authority 500b and a different rights and permissions clearinghouse 400b (top of drawing) might be used to support certain activities on personal computer 124.
- A still different financial clearinghouse 200c, certifying authority 500c and usage clearinghouse 300c but the same rights and permissions clearinghouse 400b (right-hand side of drawing) might be used to support electronic activities of multimedia system 128.
- A still different combination of Commerce Utility Systems (in this example, usage clearinghouse 300c, financial clearinghouse 200d, rights and permissions clearinghouse 400c and certifying authority 500a -- along the bottom of the drawing) might be used to support sound system 130.

This example shows that various Commerce Utility Systems 90 may operate in combination, and that different combinations of Commerce Utility Systems might be used to support different electronic transactions.

**Administrative and Support Service Functions Can Be Combined Within General Purpose Commerce Utility Systems For Efficiency or Convenience**

Figure 7 shows that different special purpose Commerce Utility Systems 90 administrative and support service functions or

sub-functions may be integrated together into more general or multi-purpose Commerce Utility Systems 90 for maximum convenience, efficiency or other reasons. For example:

- 5                   •     Bob may operate an integrated or combined Commerce Utility System 90a providing a financial clearinghouse 200a function, a certifying authority 500a function, and a usage clearinghouse 300a function.
- 10                  •     Anne may operate an integrated or combined Commerce Utility System 90b providing a financial clearinghouse function 200b, a rights and permissions clearinghouse function 400b and a transaction authority function 700b.
- 15                  •     Helen may operate an integrated or combined Commerce Utility System 90c providing a rights and permissions clearinghouse function 400c and a certifying authority function 500c.
- 20                  •     Roger may operate an integrated or combined Commerce Utility System 90d providing secure directory services 600d, usage clearinghouse services 300d, financial clearinghouse services 200d and rights and permissions clearinghouse 400d.

A consumer operating electronic appliances 100 may access any or all of these different Commerce Utility Systems 90 or combinations. For example, set top box 106 might obtain rights and permissions and certificates from Helen's Commerce Utility

System 90c, but might make use of Bob's Commerce Utility System 90a for financial clearing and usage analysis.

A Commerce Utility System 90 may provide any combination of administrative and support functions or subfunctions as may be desirable to perform the operations required in certain business models, provide maximum efficiency, and/or maximize convenience. For example, Anne's Commerce Utility System 90(2) might provide only a specialized subset of financial clearinghouse function

Figure 7A shows another illustration of how Commerce Utility Systems 90 can offer a wide variety of different combinations or subcombinations of administrative and support functions. In this Figure 7A diagram, each of the various administrative and support service functions is represented (for purposes of illustration) as a different kind of child's play block:

- financial clearing functions 200 are shown as square blocks,
- Usage clearing functions 300 are shown as half-circle blocks,
- Rights and permissions clearing functions 400 are shown as rectangular blocks,
- Certifying authority functions 500 are shown as triangular blocks,
- Secure directory service functions 600 are shown as tunnel blocks, and

- Transaction authority functions 700 are shown as cylinders.

Consumer and user appliances 100 are shown as standing-up rectangular columns in the diagram. Electronic network 150 is shown as a road which connects the various Commerce Utility Systems to one another and to consumer electronic appliances 100. Electronic digital containers 152 may be carried along this electronic network or "information highway" 150 between different electronic installations.

Figure 7A illustrates just some of the many possible administrative and support service combinations that might be used. For example:

- In the upper left-hand corner, a Commerce Utility System 90A provides at least some financial clearing functions 200a, at least some rights and permissions clearing functions 400a, and at least some certifying functions 500a. This type of overall electronic Commerce Utility System 90A might, for example, be in the business of managing and granting rights on behalf of rights holders and in handling payments based on those rights.
- The Commerce Utility System 90D just to the right of installation 90A comprises financial clearing services 200d and transaction authority services 700a. It might be especially useful in, for example, auditing and/or managing an overall complex multi-step

transaction while also ensuring that appropriate parties to the transaction are paid.

- In the lower center of the diagram there is a Commerce Utility System 90B including financial clearing functions 200f and usage clearing functions 300c. This Commerce Utility System 90B could be especially useful, for example, for handling payment and other financial details relating to electronic usage transactions and also providing audit and report services based on the electronic usage.
- The Commerce Utility System 90C shown in the bottom center of the drawing combines certifying authority services 500 with usage clearing services 300f. It could be especially useful in issuing digital certificates and then tracking the usage of those certificates (for example, in order to evaluate risks, potential liability, insurance costs, etc.).

The various examples shown in Figure 7A are for purposes of illustration. Other combinations are possible or likely depending on business objectives, convenience and other factors.

### **Commerce Utility System Hierarchies**

Figure 8A shows that Commerce Utility Systems 90 or functions can be arranged in a hierarchy. For example, an overall financial (or other) clearinghouse 200(N) may oversee and/or have ultimate responsibility for the operations of numerous other

financial (or other) sub-clearinghouses 200(1), 200(2), . . . . In the Figure 8A example, a consumer electronic appliance 100 might interact with a clearinghouse 200(1), which might in turn interact with another clearinghouse 200(2), etc. This administrative and support service “hierarchy” might be thought of as being similar in some ways to a chain of command in a large corporation or in the military -- with some clearinghouses exercising and/or delegating power, control and/or supervision over other clearinghouses.

Figure 8B shows another example of a administrative and support service hierarchy. In this example, a number of centralized overall clearinghouses and/or other Commerce Utility Systems 90 delegate some or all of their work responsibilities to other Commerce Utility Systems 90. In this particular example shown, organizations, such as companies, non-profit groups or the like may have their own Commerce Utility Systems 156. Certain electronic commerce or other activities (the entertainment industry, for example) might have their own vertically-specialized Commerce Utility Systems 158. Certain geographical, territorial or jurisdictional groups (e.g., all purchasers of particular products within the state of Wisconsin) may have their own territorial/jurisdictional specialized Commerce Utility Systems 160. Commerce Utility Systems 156, 158, 160 lower in the hierarchy may, in turn, further delegate authorities or responsibilities to particular consumers, organizations or other entities.

In one example arrangement, the Commerce Utility Systems 90 to which authority has been delegated may perform

substantially all of the actual support work, but may keep the more over arching Commerce Utility Systems 90 informed through reporting or other means. In another arrangement, the over arching Commerce Utility Systems 90 have no involvement  
5 whatsoever with day to day activities of the Commerce Utility Systems to whom they have delegated work. In still another example arrangement, the more specialized Commerce Utility Systems do some of the work and the more overarching Commerce Utility Systems do other parts of the work. The  
10 particular division of work and authority used in a particular scenario may largely depend on factors such as efficiency, trustedness, resource availability, the kinds of transactions being managed, and a variety of other factors. Delegation of clearing authority may be partial (e.g., delegate usage aggregation but not  
15 financial or rights management responsibilities), and may be consistent with peer-to-peer processing (e.g., by placing some functions within consumers' electronic appliances while keeping some more important functions centralized).

20 **Multi-Function Commerce Utility Systems Can be Organized Hierarchically or Peer-to-Peer**

Figure 9 shows a still different, more complex Commerce Utility System environment including elements of both a hierarchical chain of command and a high degree of cooperation in the horizontal direction between different multi-function  
25 Commerce Utility Systems 90. In this example, there are five different levels of responsibility with a master or overarching Commerce Utility Systems 90(1) (for example, a financial

clearinghouse 200) on level 1 having the most authority and with additional Commerce Utility Systems on levels 2, 3, 4, and 5 have successively less power, authority, control, scope and/or responsibility. Figure 9 also shows that different Commerce Utility Systems on the same level may have different functions, scopes and/or areas of responsibility. For example:

- a Commerce Utility System 90(2)(1) may be a "type A" Commerce Utility System,
- Commerce Utility System 90(2)(2) might be a "type B" Commerce Utility System, and
- Commerce Utility System 90(2)(3) might be a "type C" Commerce Utility System.

On the next level down, Commerce Utility Systems might be type A Commerce Utility System (such as, 90(3)(1) and 90(3)(2)), they might be type B Commerce Utility Systems (such as, 90(3)(4)), they might be type C Commerce Utility Systems (such as, 90(3)(5), 90(3)(6)), or they might be hybrids -- such as, Commerce Utility System 90(3)(3) which is a hybrid having type A and type B functions.

Figure 9 also shows that additional clearinghouses on levels 4 and 5 might have sub-types as well as types. In the context of a financial clearinghouse 200 for example, Type A might be responsible for consumer credit, Type B for electronic checks, and Type C for commercial credit. Another demarcation might be clearing for Visa (Type A), Mastercard (Type B) and American Express (Type C). A Type A/B clearinghouse would then be a clearing delegation that could handle both consumer credit and

electronic check clearing. A Type B Subtype I might be responsible for commercial electronic checks. A Type C Subtype I might be commercial credit card transactions, and Subtype III might be credit drafts. The rationale for multiple  
5 instances might be based on jurisdictional boundaries (e.g., France, Germany, New York, and Alabama), and/or contractual arrangements (e.g., delegation of responsibility for bad credit risks, small purchasers, very large transactions, etc.) The peer-to-peer dimension might reflect a need to coordinate an overall  
10 transaction (e.g., between a small purchaser's clearinghouse and a large commercial player's clearinghouse).

A rights and permissions clearinghouse 400 might break out along content types (e.g., movies; scientific, technical and medical; and software). Subtype A might include first run movies,  
15 oldies, and art films; subtype B might handle journals and textbooks; and type C might be responsible for games, office, educational content. Peer-to-peer communications between clearinghouses could involve multimedia presentation permissions (e.g., a multimedia presentation might have permissions stored at  
20 one clearinghouse that uses a back channel to other clearinghouses to ensure that the latest permissions are distributed).

### **Some Example Commerce Utility Systems**

As described above, Commerce Utility Systems 90 are generalized and programmable -- and can therefore provide a mix  
25 of different support and administration functions to meet requirements of a given transaction. Thus, many or most

Commerce Utility Systems 90 as actually implemented may provide a range of different support and administrative functions that may make it difficult to categorize the implementation as being of one particular “kind” of Commerce Utility System as  
5 opposed to another.

Nevertheless, certain types of idealized specialized Commerce Utility Systems 90 are particularly useful for a wide range of models, transactions and applications. It is helpful and convenient to describe some of the characteristics of these “pure”  
10 Commerce Utility Systems of different types – recognizing that actual implementations may mix functions or function subsets from several of these idealized models. The following are brief vignettes of some of the characteristics of such “pure” idealized Commerce Utility Systems.

15 **Financial Clearinghouse 200**

Figure 10 shows an example financial clearinghouse 200 in more detail. Financial clearinghouse 200 handles payments to ensure that those who provide value are fairly compensated. Financial clearinghouse 200 may securely coordinate with other  
20 Commerce Utility Systems 90 in performing this task.

In this example, financial clearinghouse 200 may communicate with appliance protected processing environment 154 over electronic network 150 in a secure manner using electronic containers 152 of the type described, for example, in the  
25 Ginter et al. patent specification in connection with Figures 5A and 5B. Financial clearinghouse 200 may receive payment

information 202 from protected processing environment 154 in these secure containers 152, and interact electronically or otherwise with various banking, credit card or other financial institutions to ensure that appropriate payment is made.

- 5 Financial clearinghouse 200 may, for example, interact with a consumer's bank 206a, a provider's bank 206b and a consumer's credit card company 206c. For example, financial clearinghouse 200 can debit funds from the consumer's bank 206a and credit funds to the rights holder's bank 206b to pay for the consumers' watching of a movie, television program or other content.
- 10 Additionally or alternately, financial clearinghouse 200 may interact with a consumer's credit card company 206c to request credit checks, obtain credit authorizations, payments and the like.

- Financial clearinghouse 200 may provide payment statement statements 204 to consumers 95 -- for example, by transmitting the statements to appliance 100 in a secure electronic container 152b to preserve the confidentiality of the statement information. In this example, consumers 95 can view the statements 204 using their appliance 100 protected processing environment 154, and may also be able to print or save them for record-keeping purposes.
- 15
- 20

- In one example, the payment mechanism 118 provided by protected processing environment 154 might be an electronic wallet supplying electronic money for use in paying for electronic services or content. This electronic wallet may hold money in digital form. Consumers 95 can spend the digital money on whatever they wish. When the electronic wallet is empty,
- 25

consumers 95 can have the financial clearinghouse 200 replenish the wallet by authorizing the financial clearinghouse to debit the funds from the consumers' account in their bank 206a. Financial clearinghouse 200 may process electronic money payments, arrange for the electronic wallet to be refilled automatically (based on the consumers' pre-authorization, for example) when the consumers have spent all of its former contents, and provide the consumers with detailed reports and statements 204 about how they have spent their electronic money.

#### 10 Usage Clearinghouse 300

Figure 11 shows an example usage clearinghouse 300. Usage clearinghouse 300 in this example receives usage information 302 from usage meter 116, analyzes the usage information and provides reports based on the analysis it performs. Usage clearinghouse 300 may securely coordinate with other Commerce Utility Systems 90 in accomplishing these tasks.

For example, usage clearinghouse 300 may send the consumers 95 a detailed report 304a of all the movies, television programs and other material the consumers have watched over the last month. The communication between protected processing environment 154 and usage clearinghouse 300 may be in the form of secure containers 152. As described in the Ginter et al. patent disclosure, usage meter 116 can meter use on the basis of a number of different factors, and can range from being extremely detailed to being turned off altogether. The consumers, if they

desire, could view the detailed usage report 304a on their television set 102.

Usage clearinghouse 300 can report to others about the consumers' viewing habits consistent with protecting the consumers' privacy. These reports can also be sent within secure containers 152. For example, usage clearinghouse 300 might provide a summary report 304b to advertisers 306 that does not reveal the consumers' identity but provides the advertisers with valuable information about the consumers' viewing habits. On the other hand, with the consumers' consent, usage clearinghouse 300 could provide a more detailed report revealing the consumers' identity to advertisers 306 or to other specified people. In return, the consumers 95 could be given incentives, such as, for example, discounts, cash, free movies, or other compensation.

Usage clearinghouse 300 can also issue reports 304c to rights holders 308 – such as the producer or director of the video program 102a the consumers 95 are watching. These reports allow the rights holders to verify who has watched their program material and other creations. This can be very useful in ensuring payment, or in sending the consumers other, similar program material they may be interested in.

Usage clearinghouse 300 might also send reports 304d to a ratings company 310 for the purpose of automatically rating the popularity of certain program material. Usage clearinghouse 300 might also send reports to other market researchers 312 for scientific, marketing or other research.

**Rights and Permissions Clearinghouse 400**

Figure 12 shows an example rights and permissions clearinghouse 400. Rights and permissions clearinghouse 400 stores and distributes electronic permissions 404 (shown as a traffic light in these drawings). Permissions 404 grant and withhold permissions, and also define consequences. Rights and permissions clearinghouse 400 may work with other Commerce Utility Systems 90 to accomplish its tasks.

In this example, rights and permissions clearinghouse 400 may act as a centralized “repository” or clearinghouse for rights associated with digital content. For example, broadcasters, authors, and other content creators and rights owners can register permissions with the rights and permissions clearinghouse 400 in the form of electronic “control sets.” These permissions can specify what consumers can and can’t do with digital properties, under what conditions the permissions can be exercised and the consequences of exercising the permissions. Rights and permissions clearinghouse 400 can respond to requests 402 from electronic appliance protected processing environment 154 by delivering permissions (control sets) 188 in response.

For example, suppose that consumers 95 want to watch a concert or a fight on television set 102. They can operate their remote control unit 108 to request the right to watch a certain program. Protected processing environment 154 may automatically contact rights and permissions clearinghouse 400 over electronic network 150 and send an electronic request 402. The rights and permissions clearinghouse 400 can “look up” the

request in its library or repository to see if it has received (and is authorized to provide) the necessary permission 404b from the program's rights holder 400. It may then send the requested permission 188 to protected processing environment 154.

5           For example, permission 188 might allow the consumers to view the concert or fight only once and prohibit its copying with copy protection mechanism 120. Permission 188 may also (or in addition) specify the price for watching the program (for example, \$5.95 to be deducted from the consumers' electronic wallet).

10          Appliance 100 can ask the consumers 95 if they want to pay \$5.95 to watch the program. If they answer "yes" (indicated, for example, by operating remote control 108), the appliance 100 can automatically debit the consumers' electronic wallet and "release" the program so the consumers can watch it.

15           Rights and permissions clearinghouse 400 can deliver permissions 188 within a secure container 152b that may optionally also contain the information controlled by the permissions -- or permission 188 may arrive at a different time and over a different path than the program or other content travels to  
20          the appliance 100. For example, the permissions could be sent over network 150, whereas the program it is associated with may arrive directly from satellite 112 or over some other path such as cable television network 114 (see Figure 1).

            Rights and permissions clearinghouse 400 may also issue  
25          reports 406 to rights holders or other people indicating which permissions have been granted or denied. For example, the author of a book or video might, consistent with consumer privacy

concerns, be able to learn the exact number of people who have requested the right to publish excerpts from his or her work. These kinds of reports can supplement reports provided by usage clearinghouse 300.

5    **Certifying Authority 500**

Figure 13 shows an example of a certifying authority 500. Certifying authority 500 issues digital certificates 504 that provide a context for electronic rights management. Certifying authority 500 may coordinate with other Commerce Utility Systems 90 to  
10   accomplish its tasks.

Certifying authority 500 issues digital certificates 504 that certify particular facts. Digital certificate 122 is like a driver's license or a high school diploma in some respects, since they each provide proof of a certain fact. For example, we may show our  
15   drivers' license to prove that we are old enough to vote, buy liquor, or watch an "R" rated movie. This same driver's license attests to the fact that we have a certain name and live at a certain address, and that we have certain knowledge (of state motor vehicle laws) and skills (the ability to maneuver a motor vehicle).  
20   Digital certificate 504 is similar to that aspect of a driver's license that confirms the identity of, and related facts pertaining to the licensee, except that it is made out of digital information instead of a laminated card.

In this example, certifying authority 500 may receive  
25   consumer requests and associated evidence 502, and may issue corresponding digital certificates 504 that certify particular facts.

Certifying authority 500 may also receive evidence, credentials and possibly also certificate definitions from other people such as government authorities 506, professional organizations 508 and universities 510. As one example, the certifying authority 500  
5 might receive birth certificate or other identity information from a government authority 506. Based on this identity information, the certifying authority 500 may prepare and issue a digital certificate 504 that attests to person's identity and age. The certifying authority 500 might also issue digital certificates 504 attesting to  
10 professional status, employment, country of residence, or a variety of other classes and categories based on various evidence and inputs from various people.

Certifying authority 500 may certify organizations and machines as well as people. For example, certifying authority 500  
15 could issue a certificate attesting to the fact that Stanford University is an accredited institution of higher learning , or that the ACME Transportation Company is a corporation in good standing and is authorized to transport hazardous materials. Certifying authority 500 could also, for example, issue a  
20 certificate 504 to a computer attesting to the fact that the computer has a certain level of security or is authorized to handle messages on behalf of a certain person or organization.

Certifying authority 500 may communicate with protected processing environment 154 and with other parties by exchanging  
25 electronic containers 152. Electronic appliance 100's protected processing environment 154 may use the digital certificates 504 the certifying authority 500 issues to manage or exercise

permissions 188 such as those issued by rights and permissions clearinghouse 400. For example, set top box 106 might automatically prevent any consumer under 17 years of age from watching certain kinds of program material, or it might provide a payment discount to students watching educational material -- all  
5 based on certificates 504 issued by certifying authority 500.

### **Secure Directory Services**

Figure 14 shows an example of secure directory services 600. Secure directory services 600 acts something like a  
10 computerized telephone or name services directory. Consumers 95 can send a request 602 specifying the information they need. Secure directory services 600 can "look up" the information and provide the answer 604 to consumers 95. Secure directory services 600 can work with other Commerce Utility Systems 90 to  
15 perform its tasks.

For example, suppose consumers 95 want to electronically order a pizza from Joe's Pizza. They decide what kind of pizza they want (large cheese pizza with sausage and onions for example). However, they don't know Joe's Pizza's electronic  
20 address (which may be like an electronic phone number). Consumers 95 can use remote control 108 to input information about what they want to have looked up ("Joe's Pizza, Lakeville, Connecticut"). Protected processing environment 154 may generate a request 602 containing the identification information  
25 and send this request to secure directory services 600. It can send the request in a secure container 152a.

When secure directory services 600 receives the request 602, it may access a database to locate the requested information. Secure directory services 600 may have earlier obtained Joe's electronic address directly from Joe or otherwise. Secure  
5 directory services 600 may send the requested information back to appliance 100 in a response 604. Response 604 may also be in a secure container 152b. The consumers 95 can use this information to electronically send their order to Joe's Pizza – which can display on Joe's order terminal within a few seconds after the  
10 consumers send it. Joe may deliver to consumer 95 a piping hot cheese, sausage and onion pizza a few minutes later (by car – not electronically – since a physical pizza is much more satisfying than an electronic one).

Secure directory services 600 can help anyone connected to  
15 network 150 contact anyone else. As one example, secure directory services 600 can tell usage clearinghouse 300 how to find a financial clearinghouse 200 on network 150. Any electronic appliance 100 connected to network 150 could use secure directory services 150 to help contact any other electronic  
20 appliance.

As mentioned above, the request 602 to secure directory services 600 and the response 604 it sends back may be encased within secure containers 152 of the type described in the Ginter et al patent specification. The use of secure containers 152 helps  
25 prevent eavesdroppers from listening into the exchange between consumers 95 and secure directory services 600. This protects the consumers' privacy. The consumers 95 may not care if someone

listens in to their pizza order, but may be much more concerned about protecting the fact that they are corresponding electronically with certain other people (e.g., doctors, banks, lawyers, or others they have a relationship of confidence and trust with). Secure

5 containers 152 also help ensure that messages sent across network 150 are authentic and have not been altered. Electronic containers 152 allow Joe's Pizza to trust that the just-received pizza order actually came from consumers 95 (as opposed to someone else) and has not been altered, and the consumers can be relatively sure

10 that no one will send Joe a fake pizza order in their name. The use of secure containers 152 and protected processing environment 154 in the preferred embodiment also ensures that the consumers 95 cannot subsequently deny that they actually placed the order with Joe's Pizza if they in fact did so.

### **Transaction Authority 700**

Figure 15 shows an example transaction authority 700.

Transaction authority 700 in this example provides process control and automation. It helps ensure that processes and transactions  
5 are completed successfully. Transaction authority 700 may work with other Commerce Utility Systems 90 to perform and complete its tasks.

In more detail, transaction authority 700 in this example monitors the status of an electronic transaction and/or process and  
10 maintains a secure, reliable record of what has happened so far and what still needs to happen for the overall transaction and/or process to complete. Transaction authority 700 may also, if desired, perform a more active role by, for example, generating requests for particular actions to occur. Transaction authority 700  
15 may in some cases be the only participant in a complex transaction or process that "knows" all of the steps in the process.

Transaction authority 700 can also electronically define an overall process based on electronic controls contributed by various participants in the process.

20 Figure 15 illustrates an example of how transaction authority 700 can be used to allow consumers 95 to order merchandise such as a sweater. In this particular electronic home shopping example (which is for purposes of illustration but is not intended to be limiting in any way), the consumers 95 can use  
25 their remote control 108 to select the particular seller, style and color of a sweater they want to order at a particular price. In this home shopping example, appliance 100's protected processing

environment 154 may generate an electronic order 702 which it sends to the order receiving department 704 of an electronic “mail order” company. The order 702 may be sent within a secure container 152a.

5           In this example, transaction authority 700 may assist the electronic mail order company to coordinate activities and make sure that all steps required to deliver the sweater are performed in an accurate and timely fashion. For example:

- 10           •     Upon receiving the electronic order 702, the order receiving department 704 might provide an electronic notification 706 to transaction authority 700. The transaction authority 700 stores the electronic notification 706, and may issue a “requirement” 708.
- 15           •     Transaction authority 700 may have issued the requirement 708 before the order was placed so that the order receiving department 704 knows what to do when the order comes in.
- 20           •     In accordance with the “requirement” 708, order receiving department 704 may issue an electronic and/or paper (or other) version of the order 710 to a manufacturing department 712.
- 25           •     The transaction authority 700 may issue a manufacturing requirement 714 to the manufacturing department to make the sweater according to the consumers’ preferences.

- Transaction authority 700 might also issue a supply requirement 716 to a supplier 718. For example, transaction authority 700 may request supplier 718 to deliver supplies, such as balls of yarn 711, so  
5 manufacturer 712 has the raw materials to manufacture the sweater.
- Supplier 718 may notify transaction authority 700 when it has delivered the supplies by issuing a notification 720.
- 10 • When manufacturing department 712 has finished the sweater, it may alert transaction authority 700 by sending it a notification 722.
- In response to the notification 722 sent by manufacturing department 712, transaction authority  
15 700 may issue a shipping requirement 724 to a shipping department 726, for example, requesting the shipping department to pick up completed sweater 728 from the manufacturing department and to deliver it to the consumers.
- 20 • Transaction authority 700 may coordinate with other Commerce Utility Systems 90, such as a financial clearinghouse 200, to arrange payment.

Of course, this example is for purposes of illustration only. Transaction authority 700 may be used for all kinds of different  
25 process control and automation such as, for example, handling electronic orders and sales, electronic data interchange (EDI),

electronic contract negotiation and/or execution, electronic document delivery, inter and intra company transactions, and the secure electronic integration of business processes within or among business organizations – just to name a few of many useful applications.

### **VDE Administration Services 800**

VDE administrator 800 (see Figure 1 of this application and Figures 1A and associated discussion in the Ginter et al. specification) may, in the preferred embodiment, provide a variety of electronic maintenance and other functions to keep network 150, appliance 100 protected processing environments 154 and Distributed Commerce Utility 75 operating securely, smoothly and efficiently. For example, VDE administrator 800 may manage cryptographic keys used for electronic security throughout network 150, and may also provide services relating to the maintenance of secure data by appliances 100, the various Commerce Utility Systems 90, and other electronic appliances. As described in detail in the Ginter et al. patent disclosure, other important functions performed by VDE administrator 800 include installing and configuring protected processing environments 154, and helping protected processing environments to securely maintain stored permissions and/or usage data. The VDE administrator 800 may work with other Commerce Utility Systems 90.

**Commerce Utility Systems 90 Can Support One Another**

In addition to supporting consumers 95, Commerce Utility Systems 90 can support other Commerce Utility Systems. This is shown in Figures 16A - 16F. For example:

- 5           •     financial clearinghouse 200 can help ensure other Commerce Utility Systems 90 are paid for their contributions (see Figure 16A); and
- 10           •     usage clearinghouse 300 (see Figure 16B) may inform other Commerce Utility Systems 90 concerning how the support they provide is being used. For example, usage clearinghouse 300 may tell certifying authority 500 how the certifying authority's certificates have been used (very useful for the certifying authority to keep tabs on the amount of potential liability it is undertaking or in helping to detect fraudulent certificates).
- 15           •     Figure 16C shows that a rights and permissions clearinghouse 400 can support other Commerce Utility Systems 90 such as, for example, a financial clearinghouse 200, a usage clearinghouse 300, another rights and permissions clearinghouse 400', a certifying authority 500, a secure directory services 600, and a transaction authority 700.
- 20           •     Certifying authority 500 can issue digital certificates 504 certifying the operation of one or more other Commerce Utility Systems 90 (see Figure 16D) –
- 25

supporting other Commerce Utility Systems 90 such as, for example, a financial clearinghouse 200, a usage clearinghouse 300, a rights and permissions clearinghouse 400, another certifying authority 500',  
5 secure directory services 600, and transaction authority 700.

- Figure 16E shows that a secure directory services 600 may support other Commerce Utility Systems 90, such as, for example, financial clearinghouse 200,  
10 usage clearinghouse 300, rights and permissions clearinghouse 400, certifying authority 500, other secure directory services 600', and transaction authority 700.

- Figure 16F shows that a transaction authority 700 can  
15 support other Commerce Utility Systems 90, such as, for example, a financial clearinghouse 200, a usage clearinghouse 300, a rights and permissions clearinghouse 400, a certifying authority 500, a secure directory services 600, and another transaction  
20 authority 700'.

### **"A Piece of the Tick"**

The Commerce Utility Systems 90 described herein provide valuable, important services and functions. The operators of such services can and should be compensated for the services they  
25 provide. Financial Clearinghouse Commerce Utility Systems 200

can ensure that they and other support service providers receive this compensation without inconvenience to other electronic community and value chain participants.

In assisting or compensating value chain participants, a  
5 Commerce Utility System 90 may (based on pre-approved contractual arrangements) take its own portion or percentage to compensate it for the clearing services it provides. Support services can be compensated based on a small portion of payment (i.e., a “micro-payment”) attributable to each electronic  
10 transaction (a “piece of the tick”). Providers may pass some or all of these fees along to their own value chain participants in various ways.

Several different classes of value chain participants may be called upon to compensate the Commerce Utility Systems 90,  
15 including:

- Information Consumers (including for example, people who make use of the information “exhaust” generated by electronic commerce, electronic transaction management and rights management  
20 activities);
- Content Rightsholders and other Electronic Providers;
- Participants in the broadest range of secure, distributed electronic commerce transactions.;

- In addition, various support service providers may also need to support one another in various ways – and may therefore need to compensate one another. For example:

- 5 • One Commerce Utility System 90 may act as an intermediary for another Commerce Utility System 90's customer;
- One Commerce Utility System 90 may be required to support the operation of another Commerce Utility System 90; and/or
- 10 • Commerce Utility System 90s may need to work together to support a common transaction.

Different Commerce Utility System 90s may cooperate to establish a common fee that they then divide among themselves.

- 15 In another scenario, each Commerce Utility System 90 may independently charge for the value of its own services. There may be competition among different Commerce Utility System 90s based on quality of service and price – just as credit card companies now compete for providers' and consumers' business.

20 \* \* \* \* \*

#### **Example Distributed Commerce Utility System Architecture**

The Ginter et al. patent disclosure describes, at pages 180 and following, and shows in Figure 10-12, for example, a "Rights Operating System" providing a compact, secure, event-driven,

compartmentalized, services-based, "component" oriented, distributed multi-processing operating system environment that integrates VDE security control information, components, and protocols with traditional operating system concepts. The  
5 preferred example Commerce Utility System 90 architecture provided in accordance with these inventions builds upon and extends the Rights Operating System described in Ginter et al.

For example, the preferred example Commerce Utility System 90 architecture provides a collection of service functions  
10 that the Rights Operating System may execute as applications. These service functions define a variety of useful tasks that any and/or all Commerce Utility Systems 90 may need to perform. These service functions are distributable, scaleable and reusable. They can be combined in various combinations and sub-  
15 combinations -- depending upon business models, for example -- to provide the overall functionality desired for any particular Commerce Utility System 90 implementation.

Figure 17A shows an example overall architecture of a Commerce Utility System 90, Figure 17B shows an example of  
20 the application architecture of a Commerce Utility System, and Figure 17C shows more detail of a service function.

Referring first to Figure 17B, in this example the application software architecture for a Commerce Utility System 90 contains a commerce utility system descriptor 90A. Commerce  
25 utility system descriptor 90A contains information about the Commerce Utility System 90 that may be used to identify such system and its capabilities, as well as to describe, aggregate and/or

interface with any number of service functions 90B(1), 90B(2), ....

Commerce utility system descriptor 90A and service functions 90B may, for example, be implemented using object oriented programming techniques to help ensure that such descriptor and  
5 service functions are modular and reusable -- as well as abstracting the specifics of how actions requested of Commerce Utility System 90 are actually carried out and/or implemented.

Commerce utility system descriptor 90A(1) may also be responsible for coordinating the action of service functions 90B.

10 In this example, descriptor 90A is used to direct requests and other system actions to the appropriate service functions 90B, and to ensure that actions requiring more than one service function are coordinated by reconciling differences in interfaces, data types and the like that may exist between the service functions 90B -- as  
15 well as helping to direct overall process flow amongst the various service functions 90B. A non-exhaustive list of examples of such service functions 90B include the following:

- audit,
- maintaining records,
- 20 • overseeing processes,
- monitoring status,
- complete process definition,

- process control,
- interface(s) to settlement services,
- funds transfer,
- currency conversion,
- 5      • tax calculation and application,
- account creation and identifier assignment,
- payment aggregation,
- payment disaggregation,
- budget pre-authorization,
- 10      • status notification,
- confirmation,
- uncompleted events record,
- requirements generation,
- report generation,

- event consequences,
- account reconciliation,
- identity authentication,
- electronic currency creation,
- 5      • event database management,
- routing database,
- generating requests,
- replication,
- propagation,
- 10      • usage database management,
- bill creation and processing,
- market research,
- negotiation,
- control set database management,

- control set generation,
- process control logic,
- event flow generation,
- routing,
- 5      • archiving,
- rights and permissions database management,
- template database management,
- commerce management language processing,
- rights management language processing,
- 10      • advertising database management,
- automatic class generation,
- automatic class assignment,
- notary,
- seal generator,

- digital time stamp,
- fingerprint/watermark,
- offers and counteroffers,
- object registry,
- 5      • object identifier assignment,
- copyright registration,
- control set registry,
- template registry,
- certificate creation,
- 10    • revocation list maintenance,
- director database management,
- database query and response processing,
- other service functions.

Figure 17C shows more detail of a service function 90B. In  
15    this example, service function 90B is comprised of a service

function descriptor 90C, and any number of service application components 90D(1), 90D(2), .... Service function descriptor 90C performs a role similar to that of commerce utility system descriptor 90A, except that it acts with respect to service function 90B and service application components 90D. Service function descriptor 90C and service application components 90D may, for example, also be implemented using object oriented programming techniques to help ensure that such descriptor and service application components are modular and reusable, as well as abstracting the specifics of how actions requested of service function 90B are actually carried out and/or implemented. In this example, the service application components 90D implement most of the capabilities of the service function 90B by carrying out steps of, or subfunctions of, the service function 90B.

Figure 17A shows an example overall Commerce Utility System 90 architecture. The overall architecture shown in this example is an object oriented system in which the overall Commerce Utility System 90 is a single object, that is in turn comprised of reusable service function 90B objects. These service function 90B objects are comprised of reusable service application components (objects) 90D. Any or all of these objects may make use of the services provided by a commerce utility support service layer 90-4, as described in more detail below. The preferred embodiment Commerce Utility System architecture 90 shown is built upon the Rights Operating System 90-1 described in detail in the Ginter et al. patent specification (see Figure 12 of Ginter, et al., for example). A set of service functions 90B comprise

“applications” executed by the Rights Operating System 90-1.

There can be any number of service functions 90B.

The object oriented design of the Commerce Utility System 90 architecture shown in Figure 17A has several desirable attributes. For example, a Commerce Utility System 90 may easily add, remove and/or replace service functions 90B to alter, extend and/or enhance its capabilities. Similarly, the architecture allows the addition, removal, and/or replacement of service application components 90D to permit similar flexibility in the case of service functions. Furthermore, object oriented design significantly improves the ease and efficiency of reuse of service functions and/or service application components in different Commerce Utility Systems 90, or different service functions 90B (as shown in Figure 17A); respectively.

The application layer, which is comprised of service function layer 90-2 and service application component layer 90-3 (comprising components 90D<sub>A</sub>), may be, if desired, supported by a commerce utility support services layer 90-4. Commerce utility support services layer 90-4 may provide increased efficiency for large numbers of transactions. Such commerce utility support services 90-4 may include, for example:

- session management,
- fault tolerance,
- memory management,

- load balancing,
- database bridging, and
- other commerce utility support services.

In this example, service functions 90B are component based, and may make use of the reusable and component based service application components 90D. The service application components 90D typically perform steps of, or subfunctions of, service functions 90B. Each service application component 90D can have either or both of two parts:

- 10       a component 90-B<sub>a</sub> that need not execute within protected processing environment 154; and
- a secure component 90-B<sub>b</sub> that needs to execute within protected processing environment 154.

- 15   In this example architecture, there may be a correspondence between components 90D<sub>a</sub> and components 90D<sub>b</sub>. For example, at least one component 90D<sub>a</sub> may correspond with at least one secure component 90D<sub>b</sub>. There may be a one-to-one correspondence between components 90-D<sub>a</sub> and components
- 20   90D<sub>b</sub>(as indicated in Figure 17A by common geometric shapes). In the preferred embodiment, this separation of function permits, when required and/or desired, the interaction between secure processes operating in PPE 154 and service application components 90D. By using this architecture, it is easier and more

efficient to create service functions that implement capabilities requiring both application level support as well as secure processing.

For example, some administrative and/or support functions  
5 for performance by commerce utility systems 90 may involve use of both application level database functions as well as information protected by a protected processing environment ("PPE") 154 in the preferred embodiment. A specific example of this might be the records of payment by a user of a financial clearinghouse 200.  
10 If the operator of such a financial clearinghouse 200 chose to keep payment history information in an application level database, but needed information protected by PPE 154 in order to accurately determine the current account status of a customer, implementing a service application component 90D<sub>A</sub> that  
15 coordinated the information in the application level database with information protected by PPE 154 and processed by service application component 90D<sub>B</sub> into a single object may significantly simplify the task of using this information in the context of a given service function 90B (e.g. a decision to extend additional  
20 credit). Furthermore, this example service application component may be reusable in other service functions 90B.

In another example, service application component 90D<sub>A</sub> might serve principally as an application level interface object to a corresponding PPE 154 object 90D<sub>B</sub>. For example, if a notary  
25 service function 90B requires the application of a digital signature, a service application component 90D<sub>A</sub> might principally provide an interface that transports information to, and receives

information from, a corresponding service application component 90D<sub>B</sub> that performs essentially all of the actual work of creating and applying a digital signature. In addition, the application level service component 90D<sub>A</sub> might provide additional exception  
5 handling, protocol conversion, or other functions designed to help integrate capabilities more easily or in a different manner than originally designed for a service function 90B.

Figure 17D-1 shows an example correspondence between service functions 90B and general types of useful example  
10 commerce utility systems 90. Example service functions 90B (“Audit”, “Maintaining Records”, ...) are shown horizontally. These example service functions 90B may be useful for implementing commerce utility system 90 example types (“Financial Clearinghouse”, “Usage Clearinghouse”, ...) written  
15 vertically in the row of boxes along the top of the diagram. The Figure 17D-1 diagram is not exhaustive – additional useful commerce utility system types are possible and additional service functions 90B are also possible. Indeed, the architecture of Commerce Utility System 90 ensures that both types and service  
20 functions 90B are extensible as business models or other factors change.

Although certain business needs and models may tend to inspire the use of certain combinations and collections of important service functions in almost any implementation, the  
25 Commerce Utility System 90 architecture is inherently flexible – allowing the implementer to freely mix and combine a variety of different service functions depending upon their needs. For

example, it is useful to provide a Commerce Utility System 90 that functions as a “financial clearinghouse 200” – providing payment processing, communications, database management, and other related service functions. The Commerce Utility System  
5 architecture can provide such a “financial clearinghouse” – and is also inherently much more generalized and generalizable. For example, a particular Commerce Utility System 90 implementation of a “financial clearinghouse” could also combine “non-financial” service functions with financial service functions.  
10 The particular functions or sets of functions that are realized in any given Commerce Utility System 90 implementation depend upon the individual needs of the implementer – as dictated for example by business model(s) or functions.

Figure 17D-2 shows, for example, how the overall  
15 functionality of an example “financial clearinghouse” commerce utility system 200 can be constructed from example service functions 90B. In this example, the service functions 90B surrounded by darker lines are included within the commerce utility system descriptor 90a shown in Figure 17B. Figure 17D-2  
20 shows an example usage clearinghouse commerce utility system 300 constructed based on a different subset of service functions 90B surrounded by dark lines (shown in Figure 17D-1). Comparing Figures 17D-2 and 17D-3, one can see that some service functions 90B (for example, “audit,” “status notification,”  
25 “event database management,” etc.) may be reused for both financial and usage clearing operations. A combination financial and usage clearinghouse commerce utility system 90 might use the

union of the service functions 90B surrounded by dark lines in Figure 17D-2 and the service functions 90B surrounded by dark lines in Figure 17D-3. More, less and/or different functionality can be provided for a particular commerce utility system 90  
5 simply by providing and invoking more, less and/or different service functions 90B.

### **Distributing Commerce Utility System 90**

The secure application components 90-3 described above may, in the preferred embodiment, include or comprise reciprocal  
10 control structures and associated rules and methods shown in Figures 41A-41D and 48 of the Ginter et al. patent application. These reciprocal control structures can be used to interlink different or the same control sets operating on the same or different Commerce Utility Systems 90 or other electronic  
15 appliances 100. Hence, each actor can have one or more reciprocal relationships with every other actor -- with Commerce Utility System 90 involved in some role in some of the various actions.

Figures 17E-1 through 17E-4 show different examples of  
20 interaction models Commerce Utility System 90 may use to interact with an ongoing transaction or process based in part on these reciprocal control structures:

- Figure 17E-1 shows an event intermediation model in which a Commerce Utility System 90 receives an event  
25 notification 748 from a secure entity (e.g., a first protected processing environment) and generates an

event 758 which triggers activities of another (and/or the same) secure entity (e.g., a second and/or the first protected processing environment).

- 5       • Figure 17E-2 shows a different Commerce Utility System interaction model in which the first secure entity provides event notification 748 to both a Commerce Utility System 90 and another secure entity to perform a step, but the second entity awaits receipt of an authorization from Commerce Utility System 90 to proceed before it actually performs the next step in the process.
- 10       • Figure 17E-3 shows a notification model in which Commerce Utility System 90 is more of a passive bystander, receiving event notifications 748 for purposes of secure auditing but otherwise not interacting directly with the ongoing process or transaction unless needed to resolve exceptions (e.g., an error condition).
- 15       • Figure 17E-4 shows a prior authorization model in which the Commerce Utility System 90 must issue a notification 748' to one secure entity in response to receipt of an event notification 748 from that entity before that entity may pass the event notification 748 along to the next secure entity to perform the next step in a overall process or transaction.
- 20       • Figure 17E-4 shows a prior authorization model in which the Commerce Utility System 90 must issue a notification 748' to one secure entity in response to receipt of an event notification 748 from that entity before that entity may pass the event notification 748 along to the next secure entity to perform the next step in a overall process or transaction.

25       The various Commerce Utility System 90 interaction models shown in Figures 17E-1 through 17E-4 are not exhaustive or mutually exclusive -- any given transaction or process may

include some or all of these in different combinations based upon business models or other requirements.

As mentioned above, the present inventions provide techniques for distributing the operation of a particular service function 90-2 or service application component 90-3 throughout a system 50 or network – including for example to electronic appliances of individual consumers 95. Figure 17F shows an example of a control set 188 that can be used to control a remotely located protected processing environment (for example, a consumer's electronic appliance) to perform a "local" portion of a clearing operation. A Commerce Utility System 90 could deliver this control set 188 to a consumer's electronic appliance, to another Commerce Utility System 90, or to some other electronic appliance (e.g., one that is part of a communicating infrastructure). The Commerce Utility System 90 can, for example, delegate part of its clearing authority (implemented, for example, as one or more service functions 90-2, each including one or more service application components 90-3) to a process that can be performed within the protected processing environment 154 of a user's electronic appliance.

The Figure 17F example is a method 850 (e.g., meter, billing, or budget) whose AUDIT event 852(1) is processed by an audit method 854. The example meter method 850, for example, might have:

- a USE event 852(2) (e.g., "click" the meter),
- an INITIALIZE event 852(1) (e.g., prepare the meter for use),

- a RESET event 852(3) (e.g., restore the meter to a known good state after an error condition),
- an AUDIT event 852(4) (e.g., gather up records generated during USE events, as well as a copy of the current UDE value, and arrange for shipment to the auditor(s)),
- a READ USE RECORD event 852(5) (e.g., return a copy of the requested use record),
- a READ UDE event 852(6) (e.g., return a copy of the current UDE),
- a READ MDE event 852(7) (e.g. that returns a copy of the requested MDE), and
- other miscellaneous events.

15           The AUDIT event 852(4), in this example, may be linked to an audit method 854. In order to access the data in this example, the Commerce Utility System 90 might need permission in the form of access tags and/or an appropriate PERC control set defining more detailed usage permissions, and semantic knowledge of the record format written out by the meter method 850's USE event 852(2). The semantic knowledge could come from an out-of-band agreement (e.g., a standard), or through access to the MDE (or relevant MDE portion) of the meter method 850 that describes the use record format.

25           The events of audit method 854 would include a USE event 856(2) that performs the functions expected by the calling method's event -- in this case, gathering use records and a copy of

the current UDE, and sending them off. In this example, let's assume there is an INITIALIZE event 856(1) in this method as well. When called, the INITIALIZE event 856(1) would be sent internally, and its associated load module(s) would call back to the

5 READ MDE event 852(7) of the meter method 850 to learn the semantics of the use records. Then, the USE event 856(2) would be called and the load module(s) 858(2) associated with processing this event would call the appropriate events of the meter method 850 (e.g., READ USE RECORD repeatedly, and

10 READ UDE once). At this point, the expectations of the calling method have been fulfilled, except for administrative object packaging and transmission.

In order to implement more distributed clearing functions, the USE event 856(2) may do more processing. For example,

15 while reading in the USE records from the meter, the audit method 854 may implement analysis functions (e.g., categorizing the types of objects used, and reducing the information reported up the clearing chain to a simple count of how many times various types of content were accessed). Records from content types that are not

20 interesting may be discarded. The detailed records themselves may be discarded after analysis. In another example, the UDE values (e.g., how many clicks are recorded) may be compared to the number of use records retrieved, and if there is a discrepancy, they can be reported and/or acted upon locally (e.g., disabling use

25 of the objects from a given provider until further interaction). In still another example, records may have user identity information removed to ensure privacy. In a further example, some use

records may be processed and analyzed locally (and then discarded), while other detail records are saved for later processing.

Once the distributed clearing functions have been  
5 performed, the information can be packaged up in one or more administrative objects for transmission up the clearing chain to a centralized location. This may involve a direct report to the provider(s), and/or a report to another clearing function, for example. The processed records may be released (for deletion,  
10 summary, filing, etc. by the meter method) by the audit method 854 when received, processed, transmitted, or on receipt of a confirmation by the recipients.

In another example using the meter method 850 shown in Figure 17F, the AUDIT event 854 could be performed “internally”  
15 by the meter method 850. In this example, the use records and UDE would be bundled up in one or more administrative objects for transmission to the auditor(s) by the load module(s) 853 associated with the AUDIT event 854(4) of the meter method 850. However, rather than transmitting these objects, they could be  
20 processed locally. To do this, the name services record used by ROS (see Ginter et al. Figures 12 and 13) to find the named auditor(s) could be redirected back to the local PPE 154. In the PPE 154, a process controlled by the Commerce Utility System 90 can be created (based on methods and/or load modules delivered  
25 on their behalf) to perform the local clearing functions described above, except using the content of the administrative object(s), rather than calls to the meter method events. This is more

analogous to the function that would be performed at a remote clearing facility in the sense that the operations are performed on administrative objects and their contents – but the processing can instead be done on the local consumer electronic appliance, on a  
5 networked appliance.

Distributing support services in this manner provides additional capabilities that may not be present or available in a centralized architecture. For example, a rights and permissions clearinghouse could delegate a local server within an organization  
10 to keep track of requests and to cache copies of permissions previously requested by the organization. Such a local rights and permissions clearinghouse could reduce network traffic and provide a convenient local repository for organization-specific permissions (e.g., site licenses for computer software). The local  
15 rights and permissions server could be authorized by rights holders or a rights and permissioning agency or other rights distribution organization to grant licenses on a request basis.

As another example, many secure, largely automated administrative and support services may be distributed in whole  
20 and/or in part to an at least occasionally connected appliance -- regardless of whether that appliance is a computer, set top box, personal digital assistant (PDA) digital telephone, intelligent digital television, or any other digital appliance. Such appliances can use a protected processing environment to ensure that the  
25 support service is performed securely and reliably, free from tampering and other interference (e.g., as described in the Ginter, et al. patent specification).

In another example, one possible VDE content distribution scenario involves content providers performing the initial packaging role, distributors performing the distribution function, users keeping track of usage records, and clearinghouses  
5 processing usage and financial information. This is in contrast to a centralized processing model, in which all of these functions are performed by a single centralized party.

As still another example, efficiency increases can be realized by distributing clearinghouse functions across individual  
10 user machines, local area network (LAN) servers, and/or corporate “gateway” machines that bridge the corporate LAN/WAN environment with the outside world, and commercial “backbone” servers.

As another example, a company’s computer might be  
15 authorized by a central certificate authority to grant certain kinds of digital certificates. For example, the company might be a member of a certain trade organization. The trade organization’s certifying authority might give the company a digital certificate attesting to that fact, and delegate to the company’s own computer  
20 the certifying authority to issue certificates attesting to the fact that each of the company’s employees is a member of the trade organization. Similarly, parents may be authorized to issue digital certificates on behalf of their offspring.

The techniques described above illustrate how the  
25 Distributed Commerce Utility, through use of the Commerce Utility System 90 architecture, can be distributed across multiple Commerce Utility Systems. Furthermore, the service functions

90-2 provided by one or more Commerce Utility Systems 90 may be decomposed into complete, or even partial, process steps (e.g., service application components 90-2) that are performed in whole or in part on other Commerce Utility Systems 90, or any other  
5 system (including end user systems) selected by the participants in a given scenario.

### **Example Commerce Utility System Types**

#### **Financial Clearinghouse 200**

10 Figure 18 shows an example of a Financial Clearinghouse Commerce Utility System 200. "Financial Clearinghouses" support automated, efficient financial fulfillment for electronic transactions. For example, financial clearinghouse 200 may collect payment related information and details, and efficiently  
15 arrange for the transfer of money and other compensation to ensure that value providers get paid, including the automated, selective disaggregation of a payment into payment portions directed to appropriate value chain participants. Financial clearinghouses 200 may also provide credit, budgets limits, and/or  
20 electronic currency to participant (e.g., end-user) protected processing environments, wherein the financial clearinghouse may have distributed some of its operations to such protected processing environments for secure, local performance of such operations. The following are some example financial clearing  
25 support functions that can be provided through the use of the present inventions:

- Clearing of financial transactions in a secure, efficient, timely and accurate manner.
- Providing secure financial clearing on payment mechanisms that are trusted by, and convenient for value providers and users/consumers.
- Assuring payment to rights holders and other value chain participants (for example, providers who supply value to the electronic community in some part of the process from creation, to distribution, to sale, and to delivery) without requiring them to take on the task of managing a large number of financial interfaces with widely dispersed customers and/or a variety of often complex financial services standards and protocols.
- Allowing content consumers to pay for information goods and associated services using a variety of different payment vehicles via a common, trustable interface.
- Allowing each party involved in a transaction to verify that a given exchange has occurred as it was mutually intended, and to preclude repudiation of the transaction by any party.
- Reconciling accounts at time of purchase or usage reporting (e.g., transferring funds from a value chain

participant account to one or more provider accounts).

- Supporting frequent and granular transaction clearing activities.
- 5      • Providing financial clearing services to all value chain participants (e.g., buyers, distributors and sellers of digital content of all kinds as well as buyers, distributors, and sellers of physical goods and user of other services).
- 10      • Interfacing distributed electronic commerce domains with existing electronic, paper and/or other payment and/or clearing services, including but not limited to credit card systems, bank debit card systems, smart card systems, electronic data interchange, automatic clearinghouses, digital money, etc.
- 15      • The effecting, by one or more banks and/or other organizations, of settlement and reconciliation and/or interfacing directly with entities who may legally perform settlement services.
- 20      • The effecting of the creation of, and assigning of, identifying labels, numbers, names or other unique identifiers, by one or more banks and/or other organizations to digital process and/or digital information creators, information distributions and/or

modifiers, and/or customer and/or other user accounts for funds, credits and debits.

- Using secure containers in any step, part, or process of providing secure financial clearing services.
- 5      • Controlling secure financial clearing processes based, at least in part, on rules and controls stipulating the distribution of processes to be performed at each protected processing environment of a distributed financial clearinghouse systems, e.g., clearing  
10      performed by the user protected processing environments, web servers, centralized clearing facilities.
- Efficiently and securely handling conversions from one currency to another.
- 15      • Enabling payment fulfillment on provision of other consideration including service fees, product fees and/or any other fees or charges based at least in part on content, process control, and/or rights management use.
- 20      • Supporting wide use of micro-fees and micro-payments at least in part based on content, process control, and/or other usage transactions, wherein said support may include the distributed, secure accumulation and/or processing of micro-transaction

activity and the periodic passing of information related to such activity through a clearinghouse network for further processing and/or accumulation.

- 5                   • Efficiently measuring and managing micro-payment activity while minimizing transaction overhead.
- Minimizing latency in micro-payment transaction handling.
- Aggregating or “bundling” transactions against local value store or other payment vehicles (methods).
- 10               • Employing value chain rules and controls and chain of handling and control for efficiently administrating the disaggregation (splitting apart) of payments, including the assignment or transfer to different value
- 15               differing electronic control sets controlling usage and/or other permissions (e.g., securely controlling payment consequences through the parsing of payment amounts among various value chain parties as required by rules and controls before specific
- 20               payment methods are activated.
- Reducing (e.g., minimizing) the number of electronic messages required to support a given set of electronic transactions through, for example, distributed

transaction processing and/or transaction activity accumulation.

- 5      • Supporting local aggregation (bundling or combining together) of multiple payments or micro-payments at a value chain participant's site.
- 10     • Allowing value providers (e.g., value chain participants) to efficiently check another value chain participant's ability to pay before providing services or goods (physical and/or electronic) on credit.
- 15     • Allowing value providers to authorize an appropriate level of funding for estimated purchase levels on a value chain participant's preferred payment vehicle, including, for example, allowing the provision of budgets for credit and/or currency that can be expended towards all and/or only certain classes of transactions (e.g., content and/or process control types) including, for example, budgets for disbursement for expressly specified categories of expenditures such as only G and PG movies.
- 20     • Providing verification of the identity of a potential value chain participant and binding of that identity to the value chain participant's selected payment vehicle(s).

- 5      • Providing periodic reporting of transaction activity for clearinghouse reconciliation and recordation purposes. Performing auditing, billing, payment fulfillment and/or other consideration and/or other clearing activities.
- 10     • Providing event driven reporting based, for example, on time, place, depletion of local funds, and/or class of disbursement activity such as purpose (for business, entertainment, travel, household expense), family member or other individual or group identity, category of content or other goods and/or services acquired, and/or category any of type of disbursement activity
- 15     • Receiving authority from secure chain of handling and control embodied in electronic control sets.
- 20     • Granting authority and/or providing services to, and/or in conjunction with, one or more distributed financial clearinghouses that are some combination of subordinate to, and/or have peer-to-peer relationships with, one or more of said clearinghouses.
- 25     • Distributing financial clearing functions across a network or other system (for example, every consumer or other value chain participant node can perform distributed financial clearing services and wherein said participant node may communicate

financial clearing information directly to one or more other participants) and in accordance with rules and controls and other VDE techniques as described in the Ginter, et al patent specification.

- 5                   • Granting authority and/or providing services to, or in conjunction with, one or more financial sub-clearinghouses whose operations may be located logically and/or physically elsewhere, such as within a company or government agency and/or within one  
10                   or more jurisdictions and/or serving subsets of the overall business focus area of a senior financial clearinghouse.
- Distributing and/or otherwise authorizing financial clearing functions across a system or network, for  
15                   example, where every consumer and/or certain or all other value chain participant nodes can potentially support a distributed usage clearing service initiating its own, secure financial clearing transactions and function in the context of the overall clearinghouse  
20                   network including clearinghouse interoperation with one or more other participant, interoperable nodes, and as elsewhere in this list, all activities employing VDE techniques as appropriate.

- Efficiently calculating, collecting, and dispersing sales and “value added taxes” imposed by at least one jurisdiction.
- Supporting a web of financial clearinghouses in which one or more classes (groups) of clearinghouse have interoperable, peer-to-peer relationships and in which, differing groups may have differing rights to interoperate with members of other groups, for example financial clearinghouses on end-user protected processing environments may have limited rights to inter-operate with “primary” financial clearinghouses.
- Supporting a web of clearinghouse protected processing environments in which such protected processing environments comprise discreet “banks” or banking protected processing environments, and where such protected processing environments can employ VDE capabilities to securely govern and perform banking functions such as the secure storage (locally and/or remotely) of notational currency, the right to “lend” stored currency to end-user and/or other clearinghouse protected processing environments, the right to launch electronic currency objects, the right to fulfill payment from local or remote currency store(s), the ability to receive communications representing obligations to pay (e.g.,

electronic bills), the ability to fulfill such payments, and the ability to operate as a component banking “branch” of one or more virtual bank(s) (or banking network(s)) wherein such bank performs many of the roles currently performed by conventional banks.

5

- Supporting the ability for financial clearinghouses to create electronic currency that is conditionally anonymous and where such currency may be employed in the fulfillment of payment obligations and where such currency is treated as authentic without the requirement that a receiving party connect after such receipt with a remote banking authority for assessing that the currency is valid or authorized for use.

10

15

- Supporting the ability for distributed clearinghouse protected processing environments to operate – in conjunction with one or more capabilities described above -- on portable devices such as smart cards (e.g., electronic wallets, etc.) where cellular or land-line communication means (or other transport mechanisms) support on-line or asynchronous communication of information related to a current or an plural transactions such as billing or other audit information regarding commerce activity including identification, for example, of purchasers, sellers, and/or distributors, and authorization information,

20

25

budget information, credit provision, currency provision, and/or disbursement information, etc. related to such activity.

- 5                   • Supporting the provision of discounts, subsidies and/or coupons to value chain participants, for example to consumer users, in exchange for usage data or more finely grained usage data (for example, ameliorating privacy concerns in some contexts).
- 10               • May be organized hierarchically, peer-to-peer, or in a combined mode where responsibility for financial clearing may be distributed in differing fashions for differing commerce models and/or activities and/or value chains and where certain one or more parties may be, for example, hierarchically more senior to  
15               other parties in one or more instances and hierarchically a peer or less senior in one or more other instances.
- 20               • The relationship among participants is programmable and may be set (and later modified) to represent one or more desired financial clearing arrangements for given commerce activities, value chains, or models.
- Distributing payments to plural parties, including, for example, taxes to one or more governments (e.g., city, state, and federal).

Figure 18 shows an example function oriented diagram for financial clearinghouse 200. In this example, financial clearinghouse 200 is highly automated, and operates in a trusted, secure domain to provide a protected processing environment. It efficiently provides financial clearing services to all kinds of electronic commerce chains. It can also serve as a gateway between the highly secure virtual distribution environment (VDE) domain and other domains — providing protocol support for the existing infrastructure. The gateway functions can allow the highly flexible and distributed VDE protected processing environments to exploit the inflexible and centralized, but ubiquitous and trusted, existing financial infrastructure services.

The core functions of financial clearinghouse 200 relate to payment processing 208, payment aggregation 212, payment disaggregation 214, and micro-payment management 216 -- since these functions collect money from customers and other value chain participants, and pay money to value chain service or product providers such as merchants.

In more detail, financial clearinghouse 200 may perform the following functions in this example:

- payment processing 208,
- credit checks 210,
- payment aggregation 212,
- payment disaggregation 214,
- micro-payment handling 216,

- event driven reporting 218,
- reconciliation 220,
- database maintenance/management 222,
- replication 224, and
- 5 • propagation 226.

Financial clearinghouse 200 may receive payment information 202, customer information 230, provider information 232, and aggregated reports and bills 234 from the outside world. It may generate debit orders 236, credit orders 238, statements and  
10 reports 204, 240, release signals 242, and credit checks and authorizations 244.

Database management 222 and event driven reporting 218 may be used to securely provide accurate financial reports to value chain participants. Reconciliation function 220 -- which is related  
15 to both reporting and financial management -- allows financial clearinghouse 200 to provide more reliable financial management.

Replication function 224 and propagation function 226 are used by financial clearinghouse 200 to facilitate distributed processing with other financial clearinghouses 200 and/or other secure or  
20 insecure protected processing environments, permitting the financial clearinghouse to securely share state and update information with other Commerce Utility Systems or other participants.

In the example shown, the payment information 202 (which  
25 may arrive in one or more secure containers 152) is the primary input to payment processing block 208. If desired, payment

information 202 can also include some or all of the usage information sent to a usage clearinghouse 300 – or it may include different types of usage information more relevant to financial auditing and transaction tracking. This payment information 202  
5 can arrive in real time or on a delayed (e.g., periodic or other event-driven) basis.

Financial clearinghouse 200 uses provider information 232 and customer information 230 to effect funds transfers between customers and providers. Financial clearinghouse 200 uses  
10 aggregated reports and bills 234 to guide the overall payment processing 208 as well as payment aggregation 212 and payment disaggregation 214. For example, financial clearinghouse 200 may issue debit and credit orders 236, 238 to third party financial parties such as banks, credit card companies, etc., to effect  
15 debiting of consumer accounts and corresponding crediting of provider accounts. Financial clearinghouse 200 may issue statements 204 and reports 240 for secure auditing and/or informational purposes. Financial clearinghouse 200 may issue credit authorizations 244 after performing credit checks 210,  
20 thereby extending credit to appropriate value chain participants. Such authentication 244 may include an input/output function, unless they are performed entirely locally (i.e., an authorization request comes in, and clearinghouse 200 is the source of credit and/or credit limit information).

25 Financial clearinghouse 200 may issue release signals 242 in appropriate circumstances to allow electronic appliances 100 to stop maintaining and/or keep “pending” financial information

after it has been transferred, analyzed and/or processed by financial clearinghouse 200. In one example, the user appliance 100 may, within business model limitations, store the financial information even after it is "released," reduce it to a summary, etc.

- 5 Of course, it may have already done this with a copy of the data (e.g., if previously allowed to access it). For example, suppose the local copy of financial usage information contains confidential business model information. A property might cost \$1.00 to view, and that dollar may be split among several parties. Normally, the user is only aware of the overall bottom line, not the details of the split — even though a record may exist locally for each of the participants in the transaction.

- Figure 19 shows an example architectural diagram for financial clearinghouse 200. Financial clearinghouse 200 in this example includes a secure communications handler 246, a transaction processor 248, a database manager 250, a switch 252, and one or more interface blocks 244. This example financial clearinghouse architecture may be based, for example, on the operating system architecture shown in Figure 12 and 13 of the Ginter et al. patent specification (general purpose external services manager 172 in that example could support settlement service interfaces 254 for example). Secure communications handler 246 allows financial clearinghouse 200 to communicate securely with other electronic appliances 100(1) . . . 100(N). Such communications may be by way of secure digital containers 152. It is desirable for most Commerce Utility Systems 90 (including financial clearinghouse 200) to support both real time and

asynchronous receipt of containers 152. In addition, financial clearinghouse 90 may also support a real time connection protocol that does not require containers 152 for simple transactions such as making a credit card payment that doesn't have disaggregation requirements. The advantage to using a real time connection is real time results. This may be beneficial in circumstances where users need more money or credit because they have run out (rather than simply making a report or receiving a periodic replenishment of a budget that has not been exhausted), and also when a provider (e.g., of content or budget) insists on clearing a transaction before allowing whatever activity initiated the transaction to go forward.

A connection for a real time transaction doesn't always require secure containers 152, but using containers 152 even in this scenario has advantages. For example, containers 152 permit attachment of rules and controls to the contents, allowing users to specify how the contents may be used. In addition, use of containers 152 leverages existing capabilities in the protected processing environment. Using a technique such as electronic mail to deliver containers 152 (e.g., as attachments to SMTP mail messages, or as attachments to any other e-mail protocol that supports attachments) permits asynchronous processing of contents, thereby allowing Commerce Utility Systems 90 to smooth out their peak processing loads. A cost of operating a commercial clearinghouse is the depreciation expense of the equipment. The amount of equipment is principally driven by the peak load requirement. One can expect a significant variance in load (for example, compare Friday night at 8 pm versus Tuesday

morning at 3am). Smoothing out this function can lead to quite considerable savings in equipment and related costs (electricity, personnel, maintenance, etc.)

Transaction processor 248 may process and analyze  
5 received information, and database manager 250 may store received information in a database for later analysis and/or for historical analysis (to increase credit limits, analyze payment histories, etc.) In addition, database manager 250 may also store information associated with existing credit limits, addresses for  
10 communications (physical and/or electronic), and other account information. For example, the Ginter et al. patent specification discusses budget encumbrances. The database manager 250 may be used to store information used to track encumbrances as well. There may also be sets of security information used to  
15 communicate with protected processing environments and/or users employing the protected processing environments, and the settlement services. Records associated with communications with the settlement services may also be stored there as well. The database 250 may also be outfitted with various reporting facilities  
20 related to its contents.

Transaction processor 248 and database manager 250 together perform most of the functions shown in Figure 18. Switch 252 is used to route information to and from interface blocks 244. Interface blocks 244 are used to communicate with  
25 third party settlement services, such as credit card companies, Automatic Clearing House (ACH) systems for bank settlements, debit card accounts, etc. Optionally, the internal settlement

services provided by a Federal Reserve Bank 256 may be used in lieu of or in addition to the third party settlement services shown to provide settlement of accounts in accordance with prevailing banking arrangements and legal requirements. The payment  
5 mechanisms used by financial clearinghouse 200 may be symmetrical (e.g., tell VISA to charge consumer A's charge account and credit vendor Y's account) or asymmetrical (e.g., tell VISA to debit consumer A's charge account and provide the money to the financial clearinghouse which will credit vendor Y's  
10 account using some other payment mechanism) as allowed by applicable financial and banking regulations.

#### **Example Financial Clearing Processes**

Figure 20 shows an example financial clearinghouse  
15 process. In this example, a provider 164 provides goods, services or content to a consumer 95. For example, provider 164 may provide one or more digital properties 1029 and associated controls 404 within an electronic secure container 152. A secure protected processing environment 154 at the consumer 95 site  
20 keeps track of payment, usage and other information, and may provide an audit trail 228 specifying this information. Audit trail 228 may be transmitted from the site of consumer 95 to financial clearinghouse 200 within one or more secure containers 152b. Audit trail 220 might include, for example, the identification of  
25 the reporting electronic appliance 100; the amount of payment; provider identification; the consumer's desired payment method; the name or other identification of the electronic appliance user;

and the type(s) of transaction(s) involved. The time and/or frequency of reporting might be based on a number of different events such as for example, the time of day, week, month, year or other time interval; the occurrence of some related or unrelated event (e.g., pre-approval for a purchase is required, a certain number of purchases have taken place, a local electronic purse has been exhausted of funds, reporting is necessary for some other reason, etc.); or a combination of these.

Financial clearinghouse 200 analyzes the audit trail 228, and generates one or more summary reports 240. Financial clearinghouse 200 may provide the summary report 240 to provider 164 by transmitting it electronically within a secure container 152c. Financial clearinghouse 200 may also coordinate with a financial intermediary 258 and one or more financial processors 260 to effect a debiting of a bank or other account owned by consumer 95 and corresponding crediting of a bank or other account owned by provider 164.

For example, the financial clearinghouse 200 may receive the audit information, disaggregate the transactions (into value chain amounts for creators, distributors, and others; as well as for tax authorities and other governmental entities), and then calculate an amount due it from each of the transaction beneficiaries. Then, if desired or necessary (due to the size of the transactions, per transaction fees, or other efficiency and/or cost considerations), the transactions may be rolled up into lump sums for each of the parties, and submitted to a financial intermediary 258 (along with appropriate account information) that is responsible for

performing credit card transactions. The financial intermediary 258 (who may also charge a fee or take a percentage) may then cause transactions to occur at the financial processor 260 such that the beneficiaries each receive the appropriate amounts.

- 5 Alternatively, if the financial clearinghouse 200 has the ability and authorizations necessary to submit credit card transactions directly to credit card companies, it may cause the transactions to occur directly with the financial processor 260 (e.g., Visa).

Financial processor 260 may send a statement 204 to  
10 provider 164 (and/or to consumer 95) detailing the financial debits and payments that have occurred. It may provide statement 204 within a secure container (not shown) if desired. Financial clearinghouse 200 may receive a portion or percentage of the debited funds to compensate it for the financial clearing services it  
15 has provided.

Figures 20A-20F show an example financial clearing activity using a local electronic money purse 262 maintained at the consumer's electronic appliance 100. In this example, financial clearinghouse 200 may initially provide consumer 100 with  
20 electronic money in the form of electronic cash by transmitting the electronic cash within one or more secure containers 152.

Financial clearinghouse 200 may automatically debit the consumer's bank 206a or other account to obtain these funds, and may do so at the consumer's request (see Figure 20A).

- 25 The consumer's electronic appliance 100 upon receiving the electronic funds may deposit them within an electronic cash purse 262 it maintains within its protected processing environment 154

(e.g., as an "MDE" described in Ginter et al.) (see Figure 20B).

The customer's electronic appliance 100 may use this locally stored electronic money to pay for goods and services consumed by the consumer. For example, a publisher 68 may provide a work 166, such as a book, film, television program, or the like, to the consumer's electronic appliance by transmitting it within one or more secure containers 152b. The consumer may operate his or her electronic appliance 100 to open the container and access the work 166, allowing the consumer to use the work in the manner specified by its associated electronic controls (see Figure 20C).

Assuming that the rights owner requires payment in return for usage of the work 166, the consumer's electronic appliance 100 may automatically debit electronic purse 262 by the amount of payment required (in this case \$5) (Figure 20C). Additionally, electronic appliance 100 may automatically generate a usage record 264 recording this usage event. Based on time and/or other event occurrence, the consumer's electronic appliance 100 may automatically send an audit trail 264 — which may comprise a package of audit records transmitted at audit time or set of related records stored in the secure database — (or a summary of it to protect the consumer's privacy) — to financial clearinghouse 200 in the form of one or electronic containers 152c (see Figure 20D).

Upon receiving the usage record 262 and successfully storing it within its own database 250, financial clearinghouse 200 may send a release signal 242 within an electronic container 152d (see Figure 20D). This release signal 242 may allow the

consumer's electronic appliance 100 to delete the usage record 264 it had previously maintained (see Figure 20D).

The consumer may use the same or different work 166 again to prompt generation of an additional usage record 264' and to  
5 decrement the electronic purse 262 by another usage charge (in this case exhausting the purse's contents) (see Figure 20E). Exhaustion of electronic purse 262 may prompt the consumer's electronic appliance 100 to again contact financial clearinghouse 200 to request additional funds (see request 228') and to also  
10 provide usage record 264' (both pieces of information are transmitted within the same electronic container 152e in this example) (see Figure 20F).

Financial clearinghouse 200 may respond by transmitting additional electronic funds (after debiting the consumer's bank or  
15 other account), and may also provide another release signal allowing the consumer's electronic appliance 100 to delete usage record 264' (see Figure 20F). The money collected may be paid to the rights holders (after any appropriate reductions to compensate Commerce Utility Systems 90).

## 20 **Payment Disaggregation**

Figure 21 shows an example financial clearing activity involving value chain "disaggregation." Financial clearinghouse 200 in this example efficiently, reliably and securely supports payment disaggregation within a value chain. Figure 21 shows a  
25 content creator, such as an author, delivering a work 166 to a publisher 168. The publisher publishes the work (for example,

within an electronic book 166') and delivers it to a consumer 95.

In this example, the consumer 95 pays \$20 for his copy of the book 166'. The consumer's payment is "disaggregated" or split up between the author 164 and the publisher 168 based, for  
5 example, upon a contractual agreement. In this example, the publisher receives four of the consumer's \$20 and the author receives the rest.

Disaggregation allows financial clearinghouse 200 to automatically split up a consumers' payment among any number  
10 of different value chain participants. This is extremely useful in ensuring that all contributors to a product or service can reliably and efficiently receive compensation for their respective contributions.

Figure 22 shows how financial clearinghouse 200 can  
15 support the value chain disaggregation shown in Figure 21. In the Figure 22 electronic example, the customer 95 may deliver his payment electronically to financial clearinghouse 200. This payment may be in the form of electronic currency packaged within a secure electronic container 152a, or it might be in some  
20 other form (e.g., reported usage information coupled with a preexisting authorization for financial clearinghouse 200 to debit the bank account of customer 95).

Financial clearinghouse 200 may distribute appropriate shares of the customer's payment to author 164 and publisher 168  
25 in accordance with the agreement between the author and the publisher. What tells financial clearinghouse 200 who should receive the disaggregated parts of the payment? In this Figure 22

example, the work 166 may pass from the author 164 to the publisher 168 and from the publisher 168 to customer 95 in electronic form within one or more secure electronic containers 152. One or more electronic control sets 188 may be included  
5 within the same or different containers, these control sets being associated with the work 166 or other property. Control sets 188 may specify, among other things, the amount of payment customer 95 must supply in order to be able to use the work 166.

Controls 188 may also specify and control how the  
10 customer's payment will be disaggregated among the other value chain participants. For example, author 164 may specify within controls 188b the author provides, that she is to receive \$16 for each copy of work 166 purchased by an ultimate consumer 95. Because of the secure chain of handling and control provided in  
15 accordance with the virtual distribution environment (see the Ginter et al. patent disclosure), author 164 can be confident (to the degree required by the commercial priorities of the author and allowed by the strength of the overall system) that publisher 168, customer 95 and any other consumers or potential users of  
20 property 166 will be subject to this control 188b. The publisher 168 may add its own controls to the one specified by author 164, the publisher controls 188c providing a \$4 mark up (for example) that it will receive for the use of its brand name, distributing and marketing services.

25 Figure 22A shows a detailed example of how payment disaggregation can be performed within the customer's protected processing environment 154 using control sets 188 as described in

the Ginter et al patent disclosure. Ginter et al. teaches, in Figure 48 and associated text, how a control set can implement and control an overall metering, billing and budgeting process within a user's protected processing environment 154. Figure 22A

5 illustrates payment disaggregation based on one or more control sets 188 provided to a consumer's protected processing environment 154. Each of the processing blocks shown in Figure 22A may be in response to a user request (event) to open and access content.

10 In this particular example, a metering method 275 is designed to pass an event to billing method 277 whenever the consumer first uses a particular piece of content (meter event 275 could also or alternatively pass the event along each time the consumer uses the content to provide a "pay per view"

15 functionality if desired).

The billing methods 277 include two different billing methods 277a and 277b in this example. Methods 277a, 277b can be independently deliverable -- for example, the author 164 could deliver billing sub-method 277a, and the publisher 168 could

20 deliver billing sub-method 277b. Billing method 277a writes information to a billing trail data structure specifying how much the author 164 is to be paid (\$16 in this example). Billing method 277b writes information to the same or different billing trail data structure specifying how much the publisher is to be paid (\$4).

25 Billing methods 277a, 277b may each receive the open event passed along by meter method 275, and may each write billing records to the same (or different) billing trail data structure.

In this example, a budget method 279 may be delivered independently of the billing methods 277a, 277b. Budget method 279 may write records to a budget trail data structure 281 specifying (among other things) the payment disaggregation arrangement (i.e., the \$16/\$4 split between author and publisher) specified by the billing methods 277a, 277b. The budget trail data structure 281 (which is maintained independently from the data structures maintained by billing methods 277a, 277b and therefore cannot be compromised by the author 164 and/or the publisher 168) might be sent to a financial clearinghouse 200. The financial clearinghouse 200 would perform payment and debit financial clearing as described above to result in the consumer's account being debited by \$20, the author's account being credited by \$16 and the publisher's account being credited by \$4 (thus disaggregating the user's \$20 payment between the author 164 and the publisher 168). Meanwhile, the billing trail data structure could be sent to a usage clearinghouse 300 specified by the author 164 and/or the publisher 168. Usage clearinghouse 300 could analyze the billing trail data structure and let author 164 and/or publisher 168 know what payments they might expect to receive from the financial clearinghouse 200.

Thus, in this example, electronic control sets 188 may specify or define, among other things: (i) rights available in a particular digital object, (ii) the cost of exercising such rights, and (iii) how payments for exercising rights will be divided (disaggregated) among rightsholders. This ability to define payment disaggregation in advance (before customers' payment

methods and arrangements are activated) provides a high degree of efficiency and flexibility – since it can use the consumers' payment method, for example, to automatically direct parts of the consumers' payment to appropriate people who need to be compensated. Since the same electronic appliance 100 that is being used to exercise the rights is also being used to help direct payments to various different value chain participants, a portion of the overall financial clearing process is effectively distributed throughout a large number of parallel computing resources.

10 Because of the high degree of trustedness that can be provided by the system disclosed in the Ginter et al. patent specification, for example, rightsholders can release such control sets 188 into the stream of commerce with an appropriate that their payment arrangements will be carried out. Financial clearinghouse 200 can

15 help to ensure that such disaggregated payments efficiently and rapidly reach their required destinations.

A protected processing environment 154 at the site of customer 95 securely enforces the augmented controls 188c, requiring total payment and/or payment authorization from the

20 customer 95 before allowing the customer to access work 166. Controls 188c may also specify which financial clearinghouse 200 is to be used to handle payment processing, and what payment methods are acceptable while still giving customer 95 flexibility in terms of choosing a desired payment method. The customer's

25 protected processing environment 154c may then automatically send appropriate payment or payment authorization 190a to financial clearinghouse 200 for disaggregation in accordance with

controls 188a -- which may be the same controls (or a subset of those controls relating to payment disaggregation) specified by the author and/or the publisher.

Because the customer's protected processing environment  
5 154c generates controls 188a subject to the controls 188c, 188b specified by the publisher and author (see Figure 22), these payment controls 188a can be trusted to carry out the payment wishes of the author and the publisher and to reflect the payment dividing agreement between the two of them. The customer's  
10 protected processing environment 154c may send the customer's payment or payment authorization 152a and these payment controls 188a to financial clearinghouse 200 within one or more secure electronic containers 152a.

Financial clearinghouse 200 processes the payment or  
15 payment authorization 152a in accordance with controls 188a, distributing payment 152b to the publisher and payment 152c to the author in accordance with the payment dividing agreement reached between the author and the publisher. Thus, for example, financial clearinghouse 200 might send \$4 of electronic money to  
20 the publisher and \$16 of electronic money to the author; or it might credit the bank or other accounts of the author and publisher in these amounts. Because this entire process takes place in a secure, trusted virtual distribution environment, each of the value chain participants can trust that they will in fact receive the  
25 payment they require and the process can be carried on automatically and electronically in a very efficient way that

flexibly accommodates a wide variety of different business models and *ad hoc* relationships.

Figure 23 shows a further, somewhat more complex payment disaggregation example that adds a content distributor or aggregator 170 to the value chain. In this example, the consumer 95's \$20 may now need to be split three ways instead of two, with the author 164 still receiving \$16, the publisher receiving only \$3 and the content distributor/aggregator 170 receiving \$1 for his or her efforts. Figure 24 shows that the same basic arrangement shown in Figure 22 can be used to accommodate the payment and other interests of this new value chain participant.

Figure 25 shows a further payment disaggregation example. Figure 25 shows how disaggregation can be used to compensate Commerce Utility Systems 90 for their role in maintaining and managing the value chain. As described above, the Distributed Commerce Utility 75 provides very important services, such as financial clearing, usage auditing, permissioning, certification, etc. Entire businesses or industries may be based on efficiently and reliably providing these kinds of administrative and support services. Commerce Utility Systems need to be compensated for their own investments and efforts. One way for them to be compensated is to receive a small part of every transaction – “a piece of the tick.” The same payment disaggregation mechanisms described above can also be used to support such micropayments to Commerce Utility Systems 90.

Figure 23 shows one example in which the Commerce Utility Systems 90 receive 3% (e.g., \$0.60 in the example shown)

of the value of each transaction. Because electronic control sets 188 discussed above can be used to implement such micro-payment capabilities, any desired business arrangement or objective can be flexibly and efficiently accommodated.

5           Figure 26 shows that payment disaggregation can be used to disaggregate or split up a single consumer payment into an arbitrary number of different amounts (even recording amounts in different types of currencies for international trading purposes) at a variety of different destinations and using a variety of different  
10          payment mechanisms (e.g., credit cards, bank accounts, electronic money, etc.).

          Figures 27 and 28 show still additional payment disaggregation examples to further illustrate the flexibility in which Distributed Commerce Utility 75 can handle these and other  
15          arrangements. The Figure 27 example shows the customer's payment being split up among the author 164, the publisher 168, the aggregator 170, a repackager 174 and two additional authors 164a, 164b supplying additional works incorporated within the electronic property being provided to the customer. The Figure 27  
20          example is particularly applicable, for example, where the repackager 174 takes content from several sources on related matters and combines them into mixed source products such as multimedia combinations, "current awareness" packages, or newsletter-like publications for sale to interested parties.

25           For example, repackager 174 might publish a newsletter on contemporary politics, and select an essay written by author 164 for publication along with two other works written by authors

164a, 164b for publication in the next newsletter issue. Authors 164, 164a and 164b may grant repackager 174 the right to reformat and redistribute the work. Taking advantage of this reformatting right, repackager 174 may create the latest issue of the newsletter and distribute it in a secure electronic container for reading by customer 95. In this example, the secure electronic container 152a may contain at least four separately "delivered" sets of business requirements -- one for each of the three works (as specified by each of author 164, author 164a and author 164b) and one for the overall newsletter (as specified by repackager 174). Alternatively, the various works and/or the controls applying to them can be sent and delivered in independent secure containers 152, and/or some or all of the works and/or controls may be located remotely.

To read the newsletter, customer 95 opens electronic container 152a. Suppose that the newsletter cost (as set by repackager 174) is \$10 per issue. The customer's \$10 payment or payment authorization is sent to financial clearinghouse 200, which resolves it to give each value chain participant compensation (for example, author 164 may get \$1, publisher 168 may get \$1, aggregator 170 may get \$.50, each additional author 164a, 164b may each get \$1 and the repackager 174 may get the rest -- all as directed by the applicable electronic controls. Thus, the repackager can be compensated for selecting appropriate articles on the topic and combining them in a single, easy to read publication, and may also bring its own brand name recognition as

an indicator of overall quality, and may itself add unique content of its own creation.

Figure 28 shows a "superdistribution" example. One key rights holder concern is copyright infringement from "pass-along" -- that is, illegal duplication and redistribution. This pass-along problem is serious in digital environments such as the Internet. The virtual distribution environment disclosed in the Ginter et al. patent specification and the administrative and support services arrangements disclosed in this specification fundamentally transform pass-along from a clear threat to an important opportunity. Because of the unique, automated, secure electronic management of value chain rights provided by the virtual distribution environment in the preferred embodiment, the consumer can be treated as a trusted member of the value chain. This makes possible a superdistribution model in which all customers become potential distributors. Since revenue from superdistribution incurs only minimal rights holder costs, superdistribution provides large profit potentials to holders of rights in successful works.

Looking at Figure 28, assume that customer 95 received a work from aggregator 170 that she likes so much that she wants to pass it along to several friends and colleagues. Assuming that aggregator 170 has granted customer 95 the right to redistribute the work, the customer may simply and easily be able to send a copy of the work to each of any number of additional potential customers 95(1) . . . 95(N). These additional people may know customer 95 and believe that she would not be sending them

something that was not potentially interesting and of high quality.

In addition, the downstream customers may be able to read an abstract or see extracts of the work (e.g., view a trailer of a film, read the first chapter of a novel, or the like) without triggering

5 payment.

After reading the abstract or watching the first five minutes of the film without cost, suppose six of the downstream customers 95(3)-95(8) agree to pay for the content at an example cost of \$3.25 each. Financial clearinghouse 200 may ensure that the  
10 author 164, publisher 168 and aggregator 170 each receive an appropriate share of the income (e.g., \$7 to the author, \$7 to the publisher and \$8.75 to the aggregator).

Superdistribution makes possible any number of levels of redistribution. For example, suppose that of the six downstream  
15 customers 95(3)-95(8), three of them decide to pass the work along to each of six additional potential customers -- so that eighteen additional people receive a copy. Since the redistributed works have associated control structures mandating the same payment arrangement, author 164, publisher 168 and aggregator  
20 170 each receive additional payments from each of these new customers. The snowballing effect of redistribution can continue in this manner across any number of consumers for a long time, and can dramatically increase revenue with minimal additional cost to the value chain members.

25

### **Payment Aggregation or Bundling**

Micro-fees and micropayments may become an important basis for content usage transactions. For example, a consumer might pay each time she views a particular work or uses a certain piece of computer software, or listens to a certain piece of music.

- 5 Different payment arrangements can be flexibly provided so that the consumer might have the option of paying a larger initial fee for unlimited usage or smaller micropayments on a per use basis. In addition, micropayments may be the least burdensome and most practical way for Commerce Utility Systems 90 to be compensated  
10 for their services. The ability to efficiently handle micropayments is thus very important in terms of supporting and enabling small charges.

Traditional financial payment mechanisms, such as credit cards, checks and the like, are unsuited to manage micropayments.

- 15 These systems typically have levels of transaction overhead that impose severe burdens on business models based on many purchases below \$5 each. For example, if it costs \$0.50 to handle a payment transaction, it becomes uneconomical to handle payments for less than some value, perhaps \$2 each because the  
20 cost of handling the payment is such a large portion of the transaction value, or even exceeds the payment itself. Hence, traditional financial payment mechanisms favor larger purchases and disfavor micro-purchases.

- Figure 29 shows how payment aggregation or bundling can  
25 be used to circumvent these concerns by reducing the number of individual financial transactions that need to be cleared, and/or by reducing the amount of messaging required to clear those

transactions. The example payment aggregation shown in Figure 29 may be performed on the consumer's own electronic appliance 100 within a protected processing environment 154; or at a centralized financial clearinghouse 200; or part of it can be performed at the appliance and part of it performed at the centralized clearinghouse. This payment aggregation process can aggregate or combine many small payments together into larger payments — or into a bundle of small payments that can be handled all at once. Such larger payments and/or bundles can be reported periodically along with other transaction data if desired to be reconciled and recorded by Distributed Commerce Utility 75. This ability to aggregate smaller payments has important beneficial effects in terms of increasing efficiency, reducing the number of individual transactions that need to be cleared, and decreasing messaging traffic over electronic network 150. Of course, payment aggregation is not necessarily suitable for every transaction (some large, critical or risky transactions may require real time clearing, for example), but can be used in a large number of routine transactions to reduce the burdens on Commerce Utility Systems 90 and overall system 50.

In one variation on this concept, payment aggregation may preserve the amounts of each individual transaction to allow high degree of reporting granularity but may be used to trigger when reporting occurs (e.g., after X dollars have been charged, or Y number of transactions have occurred) so that many individual transactions can be bundled and transmitted/processed together. This type of aggregation is useful for reducing the number and

frequency of individual messages traveling over electronic network 150. In such instances, the reporting electronic appliance 100 may report: (i) the sum of the aggregated individual transactions, or (ii) each of the individual transactions, or (iii) both, or (iv) a combination of the two.

Figure 29 shows that a consumer may use his or her electronic appliance 100 for a number of different activities, such as, for example, reading a novel, watching a video program, obtaining and reviewing research results, interacting with and enjoying multimedia presentations, and home financial management such as checkbook balancing. A per use micro-payment may be associated with each of these activities. For example, the consumer might pay \$1 to a publisher A and \$1.50 to an author A each time the consumer accesses an electronic version of a work written by the author and distributed by the publisher. Suppose that the author A's works have become so popular that they have been made into films. The consumer might pay on a per-use basis to watch one of these films -- paying the publisher A \$5, the author A \$3 and Distributed Commerce Utility 75 \$0.50.

Payment aggregators 266 (which may, if desired, operate at the consumer's site within the protected processing environment 154 provided by the consumer's electronic appliance 100) may aggregate payments to common entities, keeping a running total of the amount of money owed to publisher A, the amount of money owed to author A, and the amount of money owed to the Distributed Commerce Utility 75. This running total can be incremented each time the consumer triggers an additional

payment event. The aggregated payment amounts can be periodically or otherwise reported to financial clearinghouse 200 or other Commerce Utility Systems 90 based on certain time intervals (for example, weekly, monthly, or daily), the occurrence  
5 of certain events (for example, the consumer has exceeded her credit authorization and needs a new one, certain electronic controls have expired, etc.), and/or a hybrid of any or all of these techniques.

Figure 30 shows another example of payment aggregation  
10 across a number of consumer transactions. In this example, payments to the same value chain participants and using the same payment method are aggregated together to provide totals. This payment aggregation -- which may take place at the consumer's site and/or within a financial clearinghouse -- reduces the number  
15 of overall financial transactions that need to be cleared. This increases efficiency and throughput, and decreases the cost for handling each individual consumer transaction.

Figure 31 shows a still additional payment aggregation example in which aggregation is performed over transactions of a  
20 number of different consumers. For example, all transactions using a particular payment method pertaining to a particular provider could be aggregated by a financial clearinghouse 200. Note that the payment aggregation techniques shown in Figures 29-31 do not necessarily result in loss of individual transaction  
25 detail. In other words, it is still possible for consumer electronic appliances 100 to log and report detailed per-transaction information, and for financial clearinghouse 200 and/or the usage

clearinghouse 300 to report detailed usage information on a transaction-by-transaction basis -- even though individual transaction payments are being combined for more efficient payment processing and handling. This ability to separately  
5 handle and process more detailed and granular usage information while at the same time aggregating payments can provide a high level of auditing accountability without unduly burdening the payment handling mechanism. In some cases, loss of the detail records leads to savings on the clearinghouse side. They may be  
10 discarded, but there are advantages to keeping them around on the user's system and/or in a repository on a Commerce Utility System 90. If there is a billing dispute, for example, the local copy of the detail records might serve as useful evidence of what actually occurred -- even if they were never transmitted to the  
15 clearinghouse.

Figure 32 shows how an example financial clearinghouse 200 might be modified to include a payment aggregator component 268. Payment aggregator 268 could be used to aggregate payments incoming from a number of different  
20 consumer electronic appliances 100 or other sources, and provide those aggregated payments to switch 200 for handling via third party settlement services, for example. Payment aggregator 268 could selectively aggregate only certain payments while permitting other payments to pass through directly to switch 200  
25 for direct handling without aggregation. Payment aggregation can be based on a number of different factors. For example, payments can be aggregated based on consumer, provider, payment method,

or a combination of any or all of these factors. This aggregation function can be performed entirely or in part within consumer 95 electronic appliances, or it could be performed centrally by a centralized clearinghouse 200.

5

### **Usage Clearinghouse 300**

Figure 33 shows an example usage clearinghouse Commerce Utility System 300. Usage clearinghouses services and functions, in general, may collect, analyze and “repurpose” detailed, summary, and/or derived usage information about the use and/or execution of digital properties and/or digital processes. This information may include any information descriptive of electronic transaction activity. Usage clearinghouses and/or support services may, for example, provide and/or facilitate the following:

10  
15

- Independent auditing and reporting (which may be presented independently of financial settlement clearing services);
- General market researching;
- Negotiating, implementing, determining, and communicating levels of privacy and confidentiality with customers and value chain participants regarding such usage information; and
- Mass customized marketing and consolidated list selling, renting, or licensing.

20  
25

In more detail, usage clearing services in accordance with the present inventions may provide, for example, any combination of the following detailed features and/or functions:

- 5                   • Compiling, aggregating, using, deriving and/or providing information descriptive of and/or otherwise relating to, use of a secure container(s), secure container contents, and/or any other content and/or any digital control process(es), wherein such information describes and/or otherwise relates to (a) 10                   one or more users of content and/or processes, (b) one or more classes of content, control processes, uses of content, and/or users, and/or (c) one or more recipients of such usage information.
- 15                  • Enabling tracking and reporting of content and/or process control usage and/or processing information at a highly granular (e.g., detailed) level.
- Can collect, aggregate, analyze, summarize, extract, report, distribute, rent, license, and/or sell usage information.
- 20                  • Employing information derived from user exposure to content, such as advertising, information materials, entertainment, training materials, business productivity software applications, etc., and securely supplying at least a portion of such derived 25                  information and/or related to such information,

through the use of VDE mechanisms in the preferred embodiment, to usage information aggregating and/or analyzing clearinghouses, and where such clearinghouse securely provides at least a portion of said usage information, or information derived from said information to at least one further clearinghouse and/or value chain rightsholder; and wherein said clearinghouse may securely provide differing derived usage information to different other parties who have a clearinghouse role or other rightsholder role.

- Using the “information exhaust” audit trails created by, and/or derived from, user protected processing environment metering based on a variety of different techniques (for example those disclosed in Ginter, et al.).
- Ability to collect and analyze detailed usage information such as the number of times a digital property or any portion of a property has been opened, extracted from, embedded into, or executed; or the length of time a value chain participant has used a property such as an interactive game or multimedia presentation, computer software, or modules or subparts of such products.

- Providing a variety of repurposing capabilities for usage information arriving from consumers or other secure protected processing environments.
- 5      • Providing independent third party auditing capabilities useful, for example, for archiving and non-repudiation.
- 10      • Providing information based upon usage auditing, user profiling and/or market surveying related to use of one or more secure containers and/or content and/or VDE managed process control in the preferred embodiment.
- 15      • Providing neutral, trusted third-party audit usage aggregating and reporting services for rights holders, consumers, and/or other value chain participants and/or interested parties such as governmental bodies (information for taxation, law enforcement, commercial surveying and statistics, etc.).
- 20      • Providing audit opportunities in conjunction with rules and controls rights and permissions clearing (for example, to provide a report about which rules and controls permissions and rights, were exercised, for example by whom, for what, and when -- thereby tying actual user activity back to specific permissioning and rights and/or rules and controls
- 25      templates).

- In the preferred embodiment, providing standardized and custom reporting and analyzing based upon VDE rules and controls and produced and delivered in VDE containers to each and/or any one or more grouping of content creators, content distributors, industry analysts, trade associations, and any other stakeholders and value chain participants, and/or any other interested parties such as government statisticians, regulators, and/or taxation authorities.
- Providing any combination of raw, refined, summarized, derived, and aggregated trusted data reporting for the support of plural business models within any value chain, and/or across and/or plural value chains.
- Distributing, to value chain participants and other parties within or outside of the electronic community, usage information separately from and/or with financial settlement clearing services.
- Supporting privacy and confidentiality controls fully protecting rights of all value chain participants interests related to usage information, including, for example, rights inherent in VDE chain of handling and control managed business models.
- Can accommodate privacy concerns, e.g., to not reveal more information than a consumer or value

chain content distributor, aggregator, repurposer, or other user of an electronic device that employs, in the preferred embodiment, VDE for secure, managed content or other process control, authorizes, and, for example, to inform such authorizing user of what kind of information is being gathered and/or cleared).

5

- Can be trusted to automatically, based at least in part upon rules and controls, conceal (e.g., encrypt), remove, and/or transform one or more portions of confidential or proprietary usage information before further processing of such information or delivering of such information to any one or more additional parties, including any further usage clearinghouse(s), thereby efficiently protecting privacy and confidentiality, including protecting business trade secret information.

10

15

- Protecting key business model information from prying eyes of other interested parties, and/or from inadvertent disclosure to other interested parties and/or to the public, thereby laying the foundation for truly trusted, commercial networks.

20

- Allowing value chain participants, including, for example, commercial publishers and distributors, and/or consumers and service and/or product provider organizations, to negotiate the level of detail of usage

25

information to be conveyed to any given value chain rightsholders, and wherein such level of detail may differ according to who the specific receiving parties are and the specific type and/or subtype of usage information, and where plural, differing levels of detail for differing portions of such usage information may be provided to a given usage information receiver and/or as a given deliverable, and where such determination of detail is, at least in part, determined by the rights of a given party at least in part described by VDE rules and controls information in the preferred embodiment.

- Allowing consumers and organizations to negotiate the level of detail of information conveyed to value chain rightsholders.
- Allowing consumers or other value chain participants – creators, publishers, distributors, repurposers -- to specify and/or negotiate the level(s) of detail, aggregation and/or anonymity they desire with respect to usage information regarding their usage of any given piece of content, content class, specific process, process class, and/or payment requirement (e.g., anonymity, and/or the maintenance of privacy related to some or all usage details, may require a payment premium to offset the loss of the value of such information).

- Allowing information consumers and/or other value chain participants to customize their “information exhaust” and to set rules and controls for how they wish to have their usage information aggregated, or otherwise used – subject to the competing requirements of rightsholders to receive information they are entitled to and/or receive information that user and rightsholders mutually, electronically agree may be provided to rightsholders. Users and/or one or more rightsholders may have the right to specify limits upon (e.g., use VDE chain of handling and control), and/or describe specific usage information that may or must be to be delivered to, one or more other rightsholders.
- Supporting substantial value chain participant control over what kind of value chain participant usage information is accumulated, who can access which information and how such information may be used, how such information is gathered and processed, and the extent that usage records are tied to a specific value chain participant or organization.
- Securely using containers (e.g., using VDE secure containers in combination with VDE protected processing environment and communications security capabilities as described in Ginter, et al.) in any step,

part, and/or process of providing secure usage clearing services.

- 5      • Supporting providing discounts, subsidies and/or coupons to value chain participants, for example to consumers, distributors, repurposers, etc., in exchange for usage data or more finely grained usage data (for example, ameliorating privacy concerns in some contexts).
- 10     • Generating and supplying to interested parties marketing research and reporting and consolidated marketing lists (for targeted mailing, direct sales, and other forms of targeted marketing. Such materials are generally analogous to independent magazine and newspaper circulation audits, television audience ratings reports, and/or commercial targeted marketing lists, but generating in a highly efficient, distributed, and secure electronic environment. Such materials, when desired, can be provided with important new forms of detail (e.g., viewing, printing, extracting, reusing, electronically saving, redistributing, etc.), with far greater granularity of information, and with customized, selective reporting of materials based upon recipients requests, payments, rights, and/or conflicts of interest with one or more parties who have a rightsholder's interest in one or more portions of the underlying information.
- 20
- 25

- Using detailed usage information to automatically generate classification hierarchies, schemes, groups, and/or classes, and automatically assigning individuals, groups of individuals, organizations, groups of organizations, digital and/or analog content or groups of digital and/or analog content to one or more classes derived from usage data created, collected, transmitted, in conjunction with at least one secure container and/or VDE in the preferred embodiment.
- Supporting advertising and marketing, including supporting efficient value chain automation of the delivery of such services, such as automatic targeting or delivery of advertising and/or other marketing materials to defined sets (e.g., one or more classes) of consumers, professionals, employees and companies, in which the sets may be defined by self-selection, usage data, usage data profiles, or by any other means, and wherein said sets may be comprised of any one or more value chain participants (e.g., creators, consumers, distributors, service providers, web sites, distributed clearinghouses) and wherein said one or more participants may receive differing, customized materials, and wherein said receiving participants may redistribute such materials, if authorized by rules and controls, and where such

participants may receive credit, coupons, monetary payment, and/or other forms of consideration for such redistribution, and where such redistribution may take the form of directing some or all of such received materials to one or more other parties at least in part based upon self-selection, usage data, usage data profiles, or by any other means, and wherein all such processes may be securely managed (e.g., supported) by internodal VDE chain of handling and control in the preferred embodiment.

- Determining payments and/or other consideration due to rights holders from advertisers based on value chain user exposure to advertising and at least in part, securely automating the distribution of portions of such consideration among plural parties having rightsholder interests related to the content and/or processes that served as a basis for determining such consideration.
- Supporting superior, targeted market segmentation and the design of more suitable information products and business models based on direct, more specific and detailed usage data and on customer and value chain preferences implied, explicit, and/or automatically derived from usage information, user profiles, class(s) identification information, etc.

- Enabling “private” usage clearinghouses (a usage clearinghouse controlled and/or operated by an organization) to acquire certain detailed usage information and where such usage clearinghouses may perform usage analysis and/or other processing of such information and provide to more centralized and/or other party clearinghouses and/or other value chain participants, selectively limited usage information (e.g., employing higher level abstractions, summary information, restrictions on and/or manner of use of usage information -- viewing, printing, saving, redistributing, etc.) for some or all of such usage information, and where differing limitations on such usage information may be applied to usage information derived from usage of differing classes of content, processes, users, and/or user groups, and where such limitation capabilities provide important additional protection of the confidential trade secret information of a company or other organization by concealing the detailed nature of certain internal activities, and where there may be a requirement by one or more other parties in a value chain for payment and/or other consideration in return for the retention of such detailed usage information.

- Enabling organizations to employ private usage data clearinghouses on corporate Intranets, where such clearinghouses are integrated with organization document workflow and/or data warehousing systems.  
5
- Receiving, with private usage organization (e.g., corporation, government agency, partnership, or any other organized operating entity) clearinghouses, usage data from electronic appliances within the organization, and aggregating records into detailed reports for internal use, and/or reporting raw, detailed data for internal use, but only aggregating usage data into summary reports for external distribution, for example, to rights holders and/or other value chain participants, and/or one or more commercial clearinghouses, and where detailed data for internal use is, in the preferred embodiment, protected as VDE protected content and access or other use of such content is limited to specified parties and/or in specified ways based, at least in part, on the specified parties securely maintained electronic identity, including, for example, any relevant party class identification information (e.g., member of a certain research group, senior executive officer) that has associated specific information usage privileges.  
10  
15  
20  
25

- Identifying and supplying, through private usage clearinghouses, usage related information providing important value usage data for allocating internal organization resources, directing research, and other important business purposes.  
5
- Distributing usage clearing (e.g., for efficiency and/or other reasons).
- Distributing usage clearing functions across a network or other system (for example, every consumer and/or other value chain participant node is potentially a distributed usage clearing service at least in part initiating its own, secure usage clearing, and where such participant node may communicate usage information directly to one or more other participants) and, in the preferred embodiment, in accordance with rules and controls and other VDE techniques as described in the Ginter, et al patent specification.  
10  
15
- Hierarchically organizing usage clearinghouses, at least in part to protect confidentiality at each level in the hierarchy.  
20
- Granting authority and/or providing services to, or in conjunction with, one or more distributed usage sub-clearinghouses whose operations may be located logically and/or physically elsewhere, such as within  
25

a company or government agency and/or within one or more jurisdictions and/or serving subsets of the overall business focus area of a senior usage clearinghouse.

- 5           • Distributing and/or otherwise authorizing usage clearing functions across a system or network, for example, where every consumer and/or certain or all other value chain participant protected processing environment (node) can potentially support a
- 10           distributed usage clearing service, and function in the context of the overall Distributed Commerce Utility.
- Initiating its own, secure usage clearing transactions directly with one or more other participants.
- 15           • Providing interoperable operation with one or more other participant interoperable nodes, using any or all activities employing Virtual Distribution Environment techniques.
- 20           • Use of clearinghouse to generate usage information used, at least in part, in the design and/or marketing of products and/or services related to the products and/or services whose usage is described by such usage information.
- May be organized hierarchically, peer-to-peer, or in a combined mode where responsibility for usage

clearing may be distributed in differing fashions for  
differing commerce models and/or activities and/or  
value chains, and where certain one or more parties  
may be, for example, hierarchically more senior to  
5 other parties in one or more instances, and  
hierarchically a peer or less senior in one or more  
other instances, that is, the relationship among  
participants is programmable and may be set (and  
later modified) to represent one or more desired usage  
10 clearing arrangements for given commerce activities,  
value chains, or models.

Figure 33 shows an example usage clearinghouse 300 from  
a process point of view. Usage clearinghouse 300 in this example  
collects, analyzes and reports on the usage of digital information  
15 including, but not limited to, the usage of digital content. Usage  
clearinghouse 300 in this example performs the following  
functions:

- Data collection 314,
- Database management 316,
- 20 • Privacy control 318,
- Secure auditing 320,
- Secure reporting 322,
- Data aggregation 324,
- Advertising and marketing 326,
- 25 • Usage analysis 328,
- Replication 330, and

- Propagation 332.

Communication between usage clearinghouse 300 and other electronic appliances 100 may be by way of secure electronic containers 152, if desired. As explained in more detail in connection with financial clearinghouse 200, usage clearinghouse 300 may receive the containers in real time and/or on an asynchronous receipt basis. In the usage clearinghouse 300, the real time requirement may involve advertising or ratings information that loses some or all of its value as a function of time (e.g., if certain ratings information isn't delivered by a particular time, it may no longer be relevant in a given market analysis; or if advertisers don't receive usage information promptly, they may not be able to respond to customer tastes as effectively). Another case may involve a required delivery of usage information (e.g., a user on vacation returns to find their required audit date and grace period has expired, and their use of certain properties is prohibited until the audit is performed). The asynchronous delivery case would still be preferable in some instances for the same reasons as above in connection with financial clearinghouse 200.

Data collection function 314 is used to gather usage records 302 in addition to other types of information, such as, rules and controls 188 (which may provide information concerning prices and permissions, for example), financial statements 240a, detailed financial reports 240b, and requests for usage information and/or analysis 336. Data collection function 314 may closely interact with database management function 316 -- resulting in various types of information being stored and maintained in a usage or

other database. Replication and propagation functions 330, 332 may be used to synchronize the contents of database 316 with other databases (for example, maintained by other usage clearinghouses 300) and/or to provide a distributed database  
5 across a number of secure network protected processing environments or electronic appliances.

Data aggregation 324 and analysis 328 may be used to analyze the contents of data collected by data collection function 314 and/or stored within database 316, enabling usage  
10 clearinghouse 300 to perform auditing 320 and/or reporting 322. Privacy control 318 may be used in conjunction with reporting function 322 to expose only certain information and not others to third parties -- thereby protecting the privacy and confidentiality concerns of consumers for whom usage information has been  
15 collected. Such pending control 316 can be expressed in rules associated with the containers in which the information arrived.

Reporting function 322 may generate a variety of usage auditing reports 304. In addition, usage clearinghouse 300 may be used to provide advertising and/or marketing support 326 (e.g., to  
20 help target advertising to demographically appropriate consumers and/or to provide market and advertising research). Thus, in one example, usage clearinghouse 300 may itself produce and/or distribute advertising 340 for viewing by certain targeted consumers or deliver such advertising on behalf of others. Usage  
25 clearinghouse 300 may also generate customized responses 342 in response to information requests 336, and can also generate release signals 344 authorizing electronic appliances 100 to delete

and/or make “no longer pending” the usage information from local databases once associated audit records have been transferred to usage clearinghouse 300 and that transfer has been confirmed. Consumer 95 may have an interest in keeping rather than deleting  
5 this usage information after it has been “released” (e.g., as a matter of curiosity, to monitor others’ behavior (employees, children, etc.))

Usage clearinghouse 300 may generate its own controls 188b to, for example, govern how usage information, market  
10 analysis information or other information can be used by others. For example, usage clearinghouse 300 might be prepare a proprietary report or analysis that it provides to third parties in return for compensation. Usage clearinghouse 300 may insist that the people that they provide the report to do not redistribute the  
15 report to anyone else. Usage clearinghouse 300 may enforce this requirement electronically by delivering the report within one or more electronic containers 152, and associating electronic controls 188b with the report. These electronic controls 188b could enforce the “no redistribute” prohibition along with other  
20 conditions grants and/or limitations (e.g., the report can’t be modified, the report can be printed and viewed, the report may be excerpted, etc.).

As mentioned above, usage clearinghouse 300 may also receive financial statements 240a and/or detailed financial records  
25 240b or other financial information — and may generate its own financial statements 240c and/or detailed financial records 240d. For example, the usage clearinghouse 300 might provide a service

to content providers in which the usage clearinghouse 300 receives controls 188a from content providers similar to the controls delivered to consumers 95. Based on a comparison of these data, usage clearinghouse 300 might make estimates as to the amounts of money that the content providers should expect to receive from financial clearinghouses 200. Usage clearinghouse 300 might thus provide an independent audit function — serving as a double check on financial clearinghouses 200 and providing a fraud detection function (e.g., people submitting usage records that don't have associated payments or otherwise incorrect payment amounts may be detected by the usage clearinghouse 300). In addition, the control 188 might represent closed models that content providers are considering implementing, and usage clearinghouse 300 might then offer a service in which it runs a comparison against the usage data it actually collects to build a model of what the financial results might look like if the content provider actually instituted the proposed model.

Figure 34 shows an example architecture of usage clearinghouse 300. In this example, usage clearinghouse 300 includes a secure communications facility 346, a database and transaction processor 348, an authenticator 350, an authorization checker 352 and a data aggregator 354. Usage clearinghouse 300 architecture may be based on the rights operating system architecture shown in Figures 12 and 13 of the Ginter et al. patent disclosure.

Secure communications 346 provides communications with a variety of electronic appliances 100 over electronic network 150

via secure containers 152 in this example. Database and transaction processor 348 in this example performs most of the Figure 33 functions. An authenticator 350 may be used to authenticate consumers and/or data, an authorization checker 352  
5 may be used to check authorizations, and a data aggregator 354 may be used to perform the data aggregation function 324. Authenticator 350 and authorization checker 352 perform authentication functions as described in the Ginter et al. disclosure in connection with secure electronic appliances and protected  
10 processing environments.

Figure 35 shows an example overall usage clearing process. In this example, a provider 164 provides a digital property to consumers 95(1), 95(2), 95(3). For example, provider 164 might provide a novel or other work 166 to each of the consumers 95  
15 within electronic containers 152. One or more control sets 188 may be associated with the work 166 (and may, in one example, be delivered within the same electronic container 152 used to deliver the work 166). The controls 188 may specify that certain types of usage information must be gathered in the form of an  
20 audit trail, and that the audit trail must be reported based on certain time and/or other events.

Because container 152 can only be opened within a secure protected processing environment 154 that is part of the virtual distribution environment described in the above-referenced Ginter  
25 et al. patent disclosure, provider 164 can be confident that the required audit trails will be generated and reported as he or she instructs. As consumers 95 use the property 166, their electronic

appliances 100 automatically gather and store the usage information in the form of audit trails 302. Then, upon the occurrence of a specified event (e.g., once a month, once a week, after a certain number of uses, etc.), the consumer electronic  
5 appliances 100 send audit trail information 302 within digital containers to usage clearinghouse 300.

Usage clearinghouse 300 collects the audit trail information 302, may store it in its database 316, and analyzes the audit trail information to generate a report 304 which it may send to provider  
10 164 within a further electronic container 152.

Provider 164 automatically receives secure information auditing the amount his or her work has been used and how it has been used, with usage clearinghouse 300 relieving the provider from having to collect or analyze this detailed usage information.  
15 In addition, usage clearinghouse 300 may serve to protect the privacy of consumers 95 by revealing only summary details authorized by them (for example, how many consumers have used the work 166 but not their names or addresses). This confidentiality function would be more difficult or problematic if  
20 provider 164 attempted to analyzed detailed usage records himself or herself.

Figure 36 shows a more detailed example usage clearing process involving two different usage clearinghouses 300(1), 300(2). In this example, a provider 164 delivers a work 166  
25 directly to consumers 95, and also to distributors 168 that may redistribute the work to the consumers. The controls 188 associated with the distributed content 166 may specify that usage

clearinghouse 300(1) is to collect and analyze information relating to the usage of the content 166 directly distributed by creator 164, and that another usage clearinghouse 300(2) is to collect and analyze usage information pertaining to the usage of the work 166 as distributed by distributor 168. Alternatively, usage clearinghouses 300(1), 300(2) may gather different types of usage information pertaining to the same electronic property 166 (for example, one usage clearinghouse might gather information pertaining to "pay per view" usage, whereas the other usage clearinghouse might gather usage information for all one-time purchases). Usage clearinghouses 300(1), 300(2) may each issue reports 304 to creator 164 and/or distributor 168 and/or consumer 95.

Figure 37 shows how a usage clearinghouse 300 can be used in combination with a financial clearinghouse 200. In this example, a consumer's electronic appliance 100 may send:

- to usage clearinghouse 300, audit trail information 302 pertaining to usage of electronic content, and
- to financial clearinghouse 200, usage and payment audit trial information 228 pertaining to financial clearing activities.

If desired, usage clearinghouse 300 and financial clearinghouse 200 may be operated by the same business (in this case, both usage and financial audit trail information could be sent within the same electronic container 152). The usage clearing functions performed by usage clearinghouse 300 may operate in

parallel with the financial clearing functions performed by financial clearinghouse 200 to support both detailed usage reporting and efficient financial clearing.

Figure 38 shows another example usage clearing operation based on media and/or advertising content placement. Consumers 95(1), 95(2), 95(N) may subscribe to various information distribution services 170A, 170B, . . . . These information distribution services 170 may distribute program material and advertisements (commercial content) produced by content providers 164. Consumers 95 consume the distributed content, and their electronic appliances 100 gather and report associated usage data to usage clearinghouses 300(1), 300(2). . . .

The usage clearinghouses 300 may perform demographic analysis on the received usage data and, based on this demographic analysis, target particular ads for other commercial content 164 to particular information services 170. For example, information service 170A might distribute program material and commercial content 164 of interest to runners and others with physical fitness interests. Usage clearinghouse 300(1) might analyze the usage data provided by the consumers 95 who subscribe to and view this type of information. Usage clearinghouse 300(1) is thus in a unique position to place ads in other commercial and non-commercial content that might be of interest to the same interest group. Similarly, information service 170B might specialize in broadcasting information of interest to car enthusiasts. Usage clearinghouse 300(2) may gather usage data about the usage of this type of information -- and is thus in a

unique and well placed position to distribute and target advertisements, commercial and non-commercial content to this group of consumers.

Figure 39 shows an additional example usage clearing operation that may be performed by usage clearinghouse 300. In this example, usage clearing house 300 may be authorized by rights holders 164 to offer discounts based on the amount of usage information a consumer 95 is willing to disclose. This can, for example, be done with controls 188 for the property by selecting from among control sets and/or entering into an electronic negotiation (see Ginter et al. Fig. 76A and B). A rights holder might premeditate this as a general rule for their property — or given rights and permissions clearinghouses 400 could be authorized to deliver these control sets (e.g. based on their special position as collectors of particular categories of usage information).

As one example, the consumer's electronic appliance might be a personal computer, and rights holders 164 who distribute computer software may be interested in knowing what software programs consumer 95 is using in addition to the ones they themselves are distributing. Consumer 95, on the other hand, may not want to reveal this detailed information about all of the software programs that are present on his or her personal computer.

As another example, digital broadcast rights holders 164 may want to know about every broadcasted program that

consumer 95 watches, whereas the consumer may not want anyone else to know the kinds of programs he or she is interested in.

Usage clearinghouse 300 can effectively accommodate these countervailing interests by offering consumer 95 a financial  
5 incentive for more full disclosure but giving the consumer a choice.

In this example, rights holder 164 distributes electronic content and associated controls to consumer 95. The controls may specify options for revealing usage information. The consumer  
10 may choose:

- to pay full price and keep all usage information other than that essential for insuring payment absolutely secret;
- to allow limited usage disclosure in return for a small discount on price; or
- 15 • to take advantage of a big discount in return for allowing full disclosure of usage information.

Some secretive consumers may want the outside world to know as little as possible about their usage habits and will be willing to pay full price to protect their privacy. Other consumers  
20 may not care what the outside world knows about their usage habits, and will want to take advantage of large discounts based upon more full disclosure. Any number of such option levels may be provided, allowing the consumer to, for example, select precisely what kinds of information are revealed and which ones  
25 are kept secret. Because usage data is being collected within a secure protected processing environment 154 that is part of the consumer's electronic appliance 100, the consumer can be

confident that the usage data will be securely handled and that unauthorized disclosure will not occur without his or her consent.

Based, for example, on one or more control sets 188 provided to the consumers' protected processing environment 154 and/or the consumer's selection made possible through such control sets, the consumer's protected processing environment 154 could reveal no (or minimal) usage information, limited usage information or full usage information, to usage clearinghouse 300. Usage clearinghouse 300 can then freely analyze the limited and full usage information it collects, providing reports and analysis to rights holders 164 and to other third parties such as market researchers, brokers, advertisers, auditors, scientists and others.

#### **Rights and Permissions Clearinghouse**

Figure 40 shows an example of a rights and permissions clearinghouse Commerce Utility System 400. Rights and Permissions clearinghouse services may perform any combination of the following overall functions:

- Registering digital objects and associated permissions, prices and/or other permitted and/or required operations supporting the execution of consequences for performing and/or failing to perform such operations;
- Providing pre-approved permissions on demand in accordance with specified circumstances and/or other requirements such as class(s) of permission requester,

fulfillment, or ability to fulfill, payment requirements, etc.;

- 5       • Securely and efficiently performing electronic copyright registration with the appropriate agency for one or more countries and/or other jurisdictional units; and
- Reporting functions.

In more detail, rights and permissions support services in accordance with these inventions that may include, for example,  
10   some or all of the following functions and features:

- Identifying, distributing and verifying specific property rights and/or other business rules and controls along a digital electronic value chain.
- 15       • Providing object registry services and rights, prices and/or other control information for registered objects.
- 20       • Assigning to each digital object at least one identifying number and/or name in accordance with its own numbering and/or naming scheme and/or in accordance with one or more numbering and/or naming schemes defined by one or more other organizations, associations (e.g., standards consortiums), companies, and/or agencies (e.g., governmental regulatory bodies).

- Receiving authority from secure chain of handling and control embodied in electronic control sets.
- Securely providing permissions (e.g., rules and controls based descriptions of permitted operations and associated consequences such as prices) for digital properties that have been registered and supporting automated association of such registered properties with rules and controls sets (e.g., updating of rules and controls, employing preset templates based upon classes of properties, etc.), that may be provided, for example, at least in part remotely and securely downloaded to the registering site during, or as a result of, such registration.
- Allowing rights holders in digital content to determine and flexibly define and securely provide to one or more rights and permissions clearinghouse ways in which they want their intellectual property products (for example, VDE protected digital properties) to be used and not used, and any consequences of such use and/or misuse.
- Providing VDE supported capabilities to distribute and manage rights and business rules (including pre-approved and other permissions) along an *ad hoc* electronic value chain, where such rights and business rules are persistently supported.

- Providing digital object permissions on demand to people authorized to use a digital object.
- Can provide different terms based on different permissions securely associated with one or more combinations of classes of users (e.g., different age groups, jurisdictions, business capabilities, consumers, creators, providers, partners, government, non-profit organizations, educational organizations, organization membership, etc.).
- Providing rights holders with assurances that the terms they set are being adhered to by a potentially diverse and distributed value chain participant base.
- Can provide controls that do not include all possible permissions and/or distribute further, required and/or desired permissions upon request on an *ad hoc* and/or pre-planned basis according to the requester's rights (class and/or individual), for example, allowing rights holders to elect to distribute only the most frequently used permissions associated with a particular digital property, and allowing appropriate parties to obtain new permissions in accordance with the rights holder's model.
- Refreshing expired permissions upon request and/or upon an automated recognition of the expiration of such rights through the use of clearinghouse database

- mechanisms and the automated provisioning and/or messaging to provide such permissions and/or notify, in the preferred embodiment, a VDE value chain participant of the need to acquire such permissions (notify such user, for example, before the user is actively attempting to use associated information and/or electronic control processes and thereby avoiding user frustration and inefficiency).
- 5
- Using secure containers such as those described in Ginter, et al., in any step, part, or process of providing secure rights clearing services.
- 10
- Creating, storing, distributions, and receiving rights and permissions “templates” allowing rights holders to efficiently and adequately specify rights, conditions and consequences, (e.g., compensation) to be associated with operations related to the use of their digital properties (and/or the use of VDE process controlled electronic events).
- 15
- Templates can directly correspond to digital control sets associated with properties, content users, user classes, and/or other digital information and/or physical or virtual sites and/or process control for event and event consequence governance.
- 20
- Templates can be self-executing.

- Templates can apply to multiple objects/instances.
- Templates can be delivered independently of any digital objects they may be associated with.
- 5       • Templates are extensible to anticipate new operations and scenarios, including, but not limited to new payment methods, pricing models and pricing levels, and new permissions.
- 10       • Templates can flexibly recognize all kinds of digital rights including, for example, distribution and transmission and/or retransmission rights.
- Templates can flexibly recognize individual identity and/or class identity rights.
- Different templates can apply to different content and/or process control arrangement property types.
- 15       • Plural templates can apply to the same property and/or process control arrangement.
- 20       • Rights and permissions clearinghouse(s) may maintain superset templates, permitting value chain participants and/or hierarchically sub-clearinghouses to modify one or more of such superset templates to create templates employing a subset and/or extended set of said one or more superset templates.

- Templates can be completed in a number of different ways using, for example, a graphical user interface and/or a rights management language.
- 5     • Template "applications" can be created and/or modified through the use of topographical, schematic, directly editable graphical representation of value chain rules and controls, where such rules and controls and value chain relationships are represented through the display of, for example, mixed iconic, positional, flow diagram, and  
10     textual information, and wherein rules and controls are implemented, for example, through the use of a rights management language, and wherein, for example, elements or higher level representation of such elements of the rights language may directly correspond to  
15     graphical representation components.
- Multiple value chain participants can contribute to and/or modify templates and/or contribute and/or modify different templates applying to the same digital information.
- 20     • Users can select between differing templates applying to the same digital information, including, for example, digital information describing and/or governing control processes (e.g., event management information) managed through, for example, secure VDE chain of  
25     handling and control.
- Distributing rights clearing functions across a network or other system (for example, every consumer and/or other

- value chain participant node is potentially a distributed rights clearing service at least in part initiating its own, secure rights clearing, and wherein said participant node may communicate rights information directly to one or more other participant, interoperable clearing nodes, in the preferred embodiment, all activities employ VDE techniques as appropriate and as described in the Ginter, et al. patent specification).
- Granting authority and/or providing services to, or in conjunction with, one or more distributed rights sub-clearinghouses whose operations may be located logically and/or physically elsewhere, such as within a company or government agency and/or within one or more jurisdictions and/or serving subsets of the overall business focus area of a senior rights clearinghouse distributing and/or otherwise authorizing rights clearing functions across a system or network, for example, where every consumer and/or certain or all other value chain participant nodes can potentially support a distributed usage clearing service initiating its own, secure rights clearing transactions and function in the context of the overall clearinghouse network, including, clearinghouse interoperation with one or more other participants interoperable nodes, and as elsewhere in this list, all activities employing, for example, VDE techniques as appropriate.

- One or more rights may be automatically provided to a participant based at least in part upon some aspect of content and/or process control usage, and such provided one or more rights may be supplied, for example, as a promotional component providing coupons in compensation for certain usage (e.g., purchasing) profile which may be directly ascertained from usage information or may be derived from a weighted formula involving a variety of variables.
- May be organized hierarchically, peer-to-peer, or in a combined mode where responsibility for rights clearing may be distributed in differing fashions for differing commerce models and/or activities and/or value chains and where certain one or more parties may be, for example, hierarchically more senior to other parties in one or more instances and hierarchically a peer or less senior in one or more other instances, that is the relationship among participants is programmable and may be set (and later modified) to represent one or more desired rights clearing arrangements for given commerce activities, value chains, or models.

Figure 40 shows an example rights and permissions clearinghouse 400 from a functional viewpoint. In this example, rights and permissions clearinghouse 400 may perform some or all of the following four main functions:

- *Object registration.* Rights and permissions clearinghouse 400 registers digital properties and their associated permissions and prices.
- 5     • *Permissions on demand.* In response to queries, rights and permissions clearinghouse 400 provides permissions 188 together with associated prices in secure electronic containers 152. The permissions controls 188 may be provided independently of the content.
- 10     • *Negotiated permissions.* In response to queries and requests, the rights and permissions clearinghouse 400 negotiates permissions and/or prices on behalf of rightsholders who have delegated this responsibility to the rights and permissions clearinghouse. The  
15     rights and permissions clearinghouse 400 may also be an intermediary in the negotiations between rightsholders and rights users. Rightsholders and rights users may negotiate among themselves and report the results of those negotiations to the rights  
20     and permissions clearinghouse.
- *Reporting.* Rights and permissions clearinghouse 400 can provide reports to augment reporting performed by financial clearinghouses 200 and/or usage clearinghouses 300.
- 25     In this example, rights and permissions clearinghouse 400 may provide some or all of the following functions:

- Permission creating, updating or changing 408,
- Permission distribution 410,
- Database management 412,
- Template definitions and/or management 414,
- 5 • Negotiating permissions 416,
- Reporting 417,
- Replication 418,
- Registration 419, and
- Propagation 420.

10       The rights and permissions clearinghouse 400's primary task of object registration is performed by database management 412. In this connection, rights and permissions clearinghouse 400 may receive control sets 188 and corresponding object identifications 422 within the same or different electronic containers 152, and  
15       then "register" this information in a database 412 for later reference. Rights and permissions clearinghouse 400 may assist rights holders in defining control sets 188 specifying rights and permissions relating to the rights holder's electronic properties by providing a template function 414. Registration process 419 and  
20       database 412 may register control sets 188 in addition to objects or properties 166.

      Rights and permissions clearinghouse 400 database function 412 and distribution function 410 may be used to distribute permissions on demand in response to requests 402, and may also  
25       be responsible for the task of distributing (via distribution function 410) all permissions relating to a particular property. Since permissions and/or prices may expire or change, rights and

permissions clearinghouse 400 can also be responsible for updating control sets 188 specifying previously issued permissions and/or prices and distributing those updated control sets.

5 Rights and permissions clearinghouse 400 may also provide a reporting function 417, issuing reports 406 pertaining to the permissions and/or prices it has issued or distributed, for example.

In this example, the operation of rights and permissions clearinghouse 400 provides audit opportunities, i.e., a channel  
10 through which to attach usage information. Such audit operations (which may, for example, be provided by integrating rights and permissions clearinghouse 400 functions with usage clearinghouse 300 functions) could be used to create integrated reports about which permissions were provided and which permissions were  
15 exercised – very valuable information for market research and business consequences as well as providing additional accountability to rightsholders.

This rights and permissions clearinghouse 400 audit function can be especially beneficial to preserve confidentiality.  
20 For example, a private rights and permissions clearinghouse 400 may be extended to provide payment aggregation in order to hide confidential individual transaction level information from the financial clearinghouse 200. In another example, a rights and permissions clearinghouse 400 can issue reports 426 indicating,  
25 for example, the number of registered objects in database 412 at the beginning of a reporting period, the number of new objects registered, and some aggregate statistics concerning perhaps the

numbers of kinds of permissions associated with these objects  
and/or average or median prices for certain kinds of objects.

Rights and permissions clearinghouse 400 can also respond  
to queries 402 with responses 428. A request, for example, may  
5 consist of a request for permissions — which may be  
automatically granted; or the request may need to be qualified by  
the rights and permission clearinghouse 400 to determine whether  
the requester is qualified to receive the permissions.

Qualifications might be established by presentation of one or more  
10 valid certificates, which might be simply checked, or stored in the  
database 412 for transmission to providers along with other  
information about permissions granted by the clearinghouse. In  
the preferred embodiment, other qualifications might be based on  
a shared secret (e.g., one or more tags from a control set 188 held  
15 by the requester) known by the requester's PPE 54 and the rights  
and permissions clearinghouse 400. This shared secret might be  
used in combination with a certificate, or in cases when  
qualification requirements are lower or have already been  
established (e.g., to have received the shared secret in the first  
20 place), the shared secret alone might be adequate to receive, for  
example, a permission that replaces or updates an expired  
permission.

Rights and permissions clearinghouse 400 also includes a  
permission negotiation engine 416 that may be used to negotiate  
25 permissions 188 that haven't been pre-approved by the rights  
holder. For example, suppose that a consumer 95 wants to  
exercise a right that is not within database 412. The consumer 95

could request the right. In response, rights and permissions clearinghouse 400 could determine whether the rights holder has authorized it to negotiate for the right on behalf of the rights holder. If the rights holder has not given the rights and permissions clearinghouse 400 the power to negotiate, the clearinghouse could contact the rights holder and request authorization and/or the permission itself. If the rights holder has granted the rights and permission clearinghouse 400 negotiating authority, the clearinghouse could enter into an electronic negotiation (see Ginter et al. Figures 75A-76B) between the consumer's control set and the rights holder's control set. The resulting negotiated control set could be sent to the consumer, allowing the consumer to exercise the right.

Figure 41 shows an example architecture for rights and permissions clearinghouse 400. In this example, rights and permissions clearinghouse 400 includes a secure communications facility 430, a database and transaction processor 432, an authenticator 434, an authorization checker 436, and a registration processor 438. As discussed above, the rights and permissions clearinghouse 400 architecture may be based on the rights operating system architecture shown in Figures 12 and 13 of the Ginter et al. patent disclosure and described in associated text.

Database and transaction processor 432 performs most of the functions shown in Figure 40. Registration processor 438 may perform the registration function 419. Secure communications facility 430 communicates securely over electronic network 150 with consumers 95, authors 164, publishers 168, aggregators 170,

repackagers 174, and other value chain participants via secure containers 152. Authenticator 434 and authorization checker 436 perform authentication functions as the Ginter et al. patent disclosure describes in connection with secure electronic  
5 appliances and protected processing environments.

Figure 42 shows an example rights and permissions clearing process. In this example, author 164 sends a work 166 with a control set 188A including controls A to a publisher 168. Publisher 168 -- in accordance with a secure chain of handling and  
10 control -- adds controls B to the control set to form a new control set 188AB. Publisher 168 publishes the work 166 with control set 188AB to consumers 95. Publisher 168 may also specify a less often used, but sometimes necessary additional set of permissions C within a more comprehensive control set 188ABC (for example,  
15 controls C may allow journalists to excerpt certain parts of work 166 for specific purposes).

Publisher 168 may register control set 188ABC (and, if desired, also control set 188AB and control set 188A) with rights and permissions clearinghouse 400. The publisher 168 may also  
20 include additional "controls over controls," or "permissions for permissions" "D" (e.g., distribution controls described in connection with Figures 79-85 of the Ginter et al. patent disclosure) along with controls 188ABC. These additional "D" controls may specify the circumstances under which rights A, B  
25 and/or C may be granted (qualification of credentials, frequency of reissue, number of controls for a given user, etc.).

Consumer 95 (or any other provider, such as an aggregator, repackager, author, or another publisher) may request a copy of any of these various control sets registered with rights and permissions clearinghouse 400. For example, if the consumer 95  
5 is a journalist who uses the work 166 in accordance with control set 188AB and decides she wants to excerpt the work for certain purposes, she may request the control super set 188ABC that publisher 168 previously registered with rights and permissions clearinghouse 400. As another example, a consumer 95 in  
10 Germany may have received the control set 188 intended for U.S. distribution, and may need to request a different control set accommodating the European legal and monetary environment. Additionally, a rightsholder may modify previously distributed controls at a later date to add new rights, provide a “sale,” take  
15 away rights, etc. – with rights and permissions clearinghouse 400 being responsible for distributing these new control sets either on demand.

Figure 42A shows another example in which consumer 95 may register with the rights and permissions clearinghouse 400 a  
20 control set 188X that pertains to an object such as a file or software program already received by consumer 95. This new control set 188X requests the rights and permissions clearinghouse 400 to send to consumer 95 a new control set 188Y for the named object whenever the controls registered for that object at the rights  
25 and permissions clearinghouse 400 are modified. The rights and permissions clearinghouse 400 may automatically send updated

control set 188Y to all registered users of a particular digital property.

In a different example, publisher 168 might distribute work 166 with a very limited control set 188X allowing the consumer 5 95 to view only the abstract and specifying rights and permissions clearinghouse 400 as a contact point for obtaining permission to view or otherwise use the content as a whole. Consumer 95 could then contact rights and permissions clearinghouse 400 to obtain a more expansive control set 188Y allowing additional levels of 10 usage. This provides a high degree of accountability and expanding auditing capabilities, since it requires consumers 95 to contact rights and permissions clearinghouse 400 in order to actually use a previously distributed property. Similarly, rights and permissions clearinghouse 400 may provide updated control 15 sets 188Y to replace expired ones. This mechanism could be used, for example, to provide a variable discount on a particular item over time (for example, to allow a movie distributor to discount its first run film six months after its initial release date without having to decide at time of initial release how much the discount 20 will be).

Figure 43 shows a further example rights and permissions clearing operation performed by rights and permissions clearinghouse 400. In this Figure 43 example, each of authors 164, publishers 168, aggregators 170, and optionally other 25 additional value chain participants, register their own control sets 188A, 188B, 188C, respectively, with a rights and permissions clearinghouse 400 — potentially also registering additional

controls controlling distribution of their provider controls. Rights and permissions clearinghouse 400 may then distribute a new, combined control set 188ABC consistent with each of the individual control sets 188A, 188B, 188C -- relieving any of the value chain participants from having to formulate any control sets other than the one they are particularly concerned about. In this example, rights and permissions clearinghouse 400 may also have an interface to other organizations (e.g., with a government agency 440, such as a Copyright Office — or with another type of organization such as professional associations). Rights and permissions clearinghouse 400 may automatically register copyright in works and other objects registered with the rights and permissions clearinghouse 400 -- reducing or eliminating such burdens from having to be performed by the rights holders themselves. The copyright registration interaction between the rights and permissions clearinghouse 400 and the government agency 440 may, for example, make use of VDE and secure containers 152.

Figures 44A-44E show an additional rights and permissions clearing process that may be performed using rights and permissions clearinghouse 400. In this example, a publisher 168 may provide a property 166 and associated control set 188a to a consumer 95 (see Figure 44A). The consumer may use her electronic appliance 100 and associated protected processing environment 154 to attempt to access the property 166 using control set 188a, but may determine that she requires an additional control set 188b in order to access the property the way she

wishes. The consumer's electronic appliance 100 may generate a request 402 to a rights and permissions clearinghouse 400 (see Figure 44B). In response, the rights and permissions clearinghouse 400 may distribute the requested control 188b  
5 containing the permissions and pricing information requested by the consumer 95 (see Figure 44C). The consumer may then use the property 166 in accordance with the control set 188 and generate usage/audit trail information 302 based on the consumer's usage (see Figure 44D). The consumer's electronic  
10 appliance 100 may report this usage information to usage clearinghouse 300, and may delete and/or release as "pending" the internally stored usage information once it receives a release signal from the appropriate clearinghouse (see Figure 44E).

### 15 **Rights Templates**

Figures 45A and 45B show example rights templates 450, and Figure 45C shows an example corresponding control set 188. Rights template 450 may be analogous in some respects to "fill in the blank" forms. Rights holders can use rights templates 450 to  
20 efficiently and effectively define the rights associated with a particular digital property. Such templates 450 are useful in framing the general purpose capabilities of the virtual distribution environment technology described in the Ginter et al. patent disclosure in terms that are sensible for a particular content  
25 industry, provider, content type or the like. This allows a user such as a provider to be presented with a focused menu of resources that be applicable or useful for a particular purpose.

For example, templates 450 may make some assumptions about the character of the content or other information being controlled, how it is partitioned or otherwise organized and/or the attributes those organizational entities have. Templates 450  
5 simplify the process of defining permissions, and reduce or eliminate the need for specialized knowledge and substantial investments of time to exploit the underlying capabilities of the virtual distribution environment. It may be possible in this example for a user to avoid using templates 450 altogether and  
10 instead define permissions 188 in terms of a rights management language (for example, a natural or computer-based language) — but a large percentage of users will prefer the easy-to-use graphics interface that templates 450 may provide — and won't mind giving up the additional flexibility and associated complexities  
15 when undertaking the day-to-day business of defining permissions for a large number of different pieces of content.

Example rights template 450 shown in Figure 45A (which may be appropriate for text and/or graphics providers for example) defines a number of different types of usage/actions relevant to a  
20 particular digital property, such as, for example, "view title," "view abstract," "modify title," "redistribute," "backup," "view content," and "print content." Rights template 450 may further provide a "menu" or list of options corresponding to each type of usage. These various options allow the rights holder to define  
25 rights that others may exercise in connection with the property. For example, the rights may comprise:

- Unconditional permission,
  - Permission conditional on payment,
  - Permission based on content,
  - Unconditional prohibition, and
- 5       • Prohibitions and/or permissions based on other factors.

Rights holders may “fill in” or select between these various options to define a “rights profile” corresponding to their particular property. In this example, rights template 450 may further models and/or levels for rights to be exercised conditional on payment. Such pricing models and levels may flexibly define a variety of different sorts of business pricing, such as, for example, one time charges, pay per view, declining cost, etc. See Figure 45B for an example of how pricing models and levels might be specified using a graphical interface.

15       Rights template 450 in this example can be self executing and/or can be “translated” or compiled automatically into one or more control sets 188 providing the necessary controls for implementing the rights holder’s selections. Figure 45B, for example, has a “view title” control 188a that allows unconditional viewing of the title as specified by the Figure 45A rights template 450. Similarly, the Figure 45B example controls 188 includes further control set elements 188(2) . . . 188(N) corresponding to other rights and permissions 188 the rights holder has defined based upon the Figure 45A rights template 450.

25       In this example, rights template 450 can be extensible. For example, as new technology enables and/or creates new operations, rights template 450 can be extended to accommodate

the new operations while still being "upward compatible" with preexisting rights templates. Different rights templates 450 can be used for different types of properties, different value chain participants, etc. -- and at the same time, certain rights templates

5 might apply to multiple objects or properties, multiple value chain participants, etc. Some rights templates 450 can be supersets of other rights templates. For example, an overall rights permissions template 450 could define all of the possible rights that might apply to a particular property or class of properties, and sub-

10 templates could be further defined to define rights associated with different consumers, classes of consumers, or rights holders. Thus, for example, an author might use a sub-template that is different from the one used by a distributor. Templates can also be recursive, i.e., they can be used to refer to other templates (and

15 similarly, the control sets they define can refer to other control sets).

Rights and permissions clearinghouse 400 might partially fill in rights template 450 -- or an automatic process could be used (based, for example, on rights holder's pre-existing instructions)

20 for completing and/or duplicating rights templates. Rights holders could use a graphical user interface to complete rights template 450 (e.g., by displaying a list of options on a computer screen and pointing and clicking with a mouse pointing device to fill in the options desired). In another example, a rights holder could define

25 his or her preferences using a rights management language that a computer could automatically compile or otherwise process to fill

in rights template 450 and/or construct associated control set(s)  
188.

Figure 46 shows an example rights and permissions clearing  
process using rights template 450. In this example, rights and  
5 permissions clearinghouse 400 and/or individual rights holders  
define rights template 450 (Figure 46, block 452(1)). The rights  
are then filled in the rights template 450 to define permissions  
granted and withheld, and associated pricing models and levels  
(block 452(2)). The rights holder associates the permissions  
10 defined by the rights template with the object (e.g., by creating  
one or more control sets 188 that reference and/or apply to the  
property being controlled) (block 452(3)). The rights holder may  
then convey the permissions (control set 188) with or separately  
from the object (block 452(4)). Rights holders may send these  
15 control sets 188 directly to consumers 95 (block 452(5)), and/or  
they may sent them to a rights and permissions clearinghouse 400  
for registration and storage in a database (block 452(6)). Rights  
and permissions clearinghouse 400 may provide such  
preauthorized permissions to consumers (block 452(7)) on  
20 demand upon receiving consumer requests (block 452(8)).

As described above, providers may control distribution of  
such pre-authorized permissions by rights and permission  
clearinghouse 400 by the mechanism of providing additional,  
“distribution controls” directing and/or controlling the distribution  
25 process.

**Certifying Authority**

Figure 47 shows an example certifying authority Commerce Utility System 500. Certifying authorities and services may, in general, create digital documents that "certify," warrant, and/or attest to some fact. Facts include, for example, identification and/or membership in a particular class, e.g., such as an organization; age group, possession of a certain credential type; being subject to one or more certain jurisdictions; and/or having a certified one or more rights to use content and/or processes for a fixed time period or terminating at a specific time.

In more detail, a certifying authority in accordance with these inventions may provide any combination of the following advantageous features and functions, for example in the form of certificates:

- Electronically certifying information used with or required by rules and/or controls such as authenticating, identity, class membership and/or other attributes of identity and/or context, and including automatically certifying said information based upon the source (for example, one or more certified provider identities) and/or class of said information.
- Providing trusted verification that a consumer or other value chain participant is who she says she is

and/or is a member of one or more particular groups, classes and/or organizations.

- 5                   • Providing trusted verification that a group of value chain participants are collectively who they say they are, wherein a plurality of certificates from different parties are tested as an aggregate and where such aggregate of certain certificates is required under certain circumstances to use content and/or execute one or more control processes.
- 10                  • Automatically producing a certificate, representing authentication of a value chain or value chain portion, as a result of the confluence of a plurality of certain certificates.
- 15                  • Anticipating, through the use of rules and controls, allowable collections of certificates from plural parties that can form a certificate that virtually represents a specific group of certified parties and in the presence of certain certificates identifying two or more anticipated parties and/or parties who have met  
20                   a certain criterion -- e.g., sufficient transaction revenue, sufficient credit worthiness, etc. -- a new certificate may be automatically generated and act as a composite certificate certifying the plural parties collective and coordinated presence, and wherein said  
25                   certificate can be associated with certain rules and

controls allowing certain electronic activities such as usage of content and/or control processes in, for example, multiparty EDI, content distribution, trading system, and/or financial transaction systems.

- 5
- Generating one or more certificates at least in part as a result of rules and controls governance of certificate creation, wherein such generated one or more certificates are produced, for example, as a result of secure rules and controls based one or more
- 10
- instructions after the satisfaction of certain required criteria such as certain specific activities by each of plural parties -- e.g. provision of one or more certificates and/or authorizations and/or usage activity and/or credit and/or payment activity and/or
- 15
- reporting activity and/or VDE supported electronic agreement activity (including, for example, electronic negotiation activity).
- Certifying other support services (e.g., financial clearinghouses, usage clearinghouses, rights and
- 20
- permissions clearinghouses, transaction authorities, and other certifying authorities, etc.).
- Certifying based on another certificate (e.g., identity) and an automatic secure database lookup which may be performed locally, across a distributed database
- 25
- arrangement, or remotely.

- 5           • Providing non-automatic (i.e., at least in part human provided or assisted) services issuing more fundamental certificates (e.g., identity certificates) based on physical evidence in addition to automatic services for issuing dependent certificates.
- May use public key cryptography, private key, and/or secure VDE virtual networks to support, e.g. create, digital certificates.
- 10          • Can issue certificates that support the context for rights usage in an automatic, trusted, distributed, peer-to-peer secure electronic environment that supports chain of handling and control.
- 15          • As with other Distributed Commerce Utility services, supporting an unlimited variety of different business models and scenarios through general purpose, reusable, programmable, distributed, modular architecture.
- 20          • Can issue certificates that support control sets having elements whose use is dependent on presence and/or absence of specific, and/or class and/or non-specific, one or more digital certificates attesting to certain facts and where differing requirements may coexist regarding the presence or absence of certificates related to differing issues.

- Can issue one or more certificates that cooperate with conditional electronic control sets to grant certain rights only to certain consumers and/or other value chain participants, including, for example, consumers.
- 5      • Issuing replacements for expired certificates and supporting sophisticated time and/or usage and/or other event driven expiration (including termination) of certificates – for example, where criteria for such expiration may vary based upon specific
- 10      certificates, classes of certificates, specific and/or classes of users, user nodes, etc.
- Maintaining and distributing, including selectively distributing to distributed nodes revocation list information, based, for example, upon node
- 15      distributed profiles and/or rules and controls.
- Distributing revocation list information among interoperable, peer-to-peer networked, Distributed Commerce Utility nodes on a time based, other event based manner, wherein information is selectively
- 20      distributed to certain one or more nodes in accordance with agreed to revocation information requirements and/or where revocation information is non-selectively distributed to certain one or more nodes.

- Receiving authority from secure chain of handling and control embodied in electronic control sets.
- Distributing certificate authority functions across a network or other system (for example, every consumer node is potentially a certificate authority with respect to certain kinds of certificates; parents may be empowered to issue certificates for their children).
- Organizing certificate authorities hierarchically, including allowing automatic verification of some certificate authorities (that is, their issued certificates and associated determinations regarding trustedness, appropriateness, etc.) through reliance on certificates issued by other certificate authorities at least in part for such purpose.
- Granting authority and/or providing services to, or in conjunction with, one or more distributed certificate authority sub-clearinghouses whose operations may be located logically and/or physically elsewhere, such as within a company or government agency and/or within one or more jurisdictions and/or serving subsets of the overall business focus area of a senior certificate authority clearinghouse distributing and/or otherwise authorizing rights clearing functions across a system or network

- Every consumer and/or certain or all other value chain participant nodes can potentially support a distributed certificate authority clearing service initiating its own, secure certificates and function in the context of the overall clearinghouse network, including, clearinghouse interoperation with one or more other participants interoperable nodes, and as elsewhere in this list, all activities employing VDE techniques as appropriate.
- Providing liability acceptance control (i.e., for insuring digital certificates based on the amount of liability accepted by the issuer(s)), and may include securely maintaining information regarding such liability acceptance and providing notices to recipients of such certificates regarding the liability protection afforded by such certificates, and may further include recipients of such insured certificates accepting, for example, through explicit VDE managed electronic acceptance or through implied acceptance by continuing, any liability above the insured amounts.
- May be organized hierarchically, peer-to-peer, or in a combined mode where responsibility for certificate authority activities may be distributed in differing fashions for differing commerce models and/or activities and/or value chains and where certain one

or more parties may be, for example, hierarchically more senior to other parties in one or more instances and hierarchically a peer or less senior in one or more other instances, that is the relationship among participants is programmable and may be set (and later modified) to represent one or more desired specific certificate authority arrangements for given commerce activities, value chains, or models.

Figure 47 shows an example certifying authority 500 from a process viewpoint. In this example, certifying authority 500 creates digital documents called certificates 504 that “certify” some fact, such as identity or class membership. For example a trusted third party certifying authority 500 can provide a secure digital assurance that a consumer is who she claims to be or has certain characteristics, attributes, class memberships, or the like. For example, some attributes may signify membership in a particular class (e.g., all employees of a certain company), those born before a certain date, those having a certain physical disability, members of the faculty, administration or student body of a college, or retired members of the armed forces.

In this example, digital certificates 504 issued by certifying authority 500 are used as a conveyor of the context of rights usage and transaction authorizations. As described in the Ginter et al. patent disclosure, certificates 504 are particularly powerful in the virtual distribution environment because they provide contexts for rights usage. For example, class-based certificate use and

automated, distributed governance of commerce rights may fundamentally enhance the efficiency of trusted networks.

Suppose, for example, that a content publisher wants to charge commercial prices for a scientific journal subscription to all those  
5 but in higher education and is willing to give college and university students and professors a 20% discount. Digital certificates 504 issued by a trusted certifying authority 500 can be used to automatically provide assurances -- within the context of distributed electronic network -- that only people who are truly  
10 entitled to the discount will be able to exercise it (in this example, that only those certified as affiliated with an institution of higher education).

In the Figure 47 example, certifying authority 500 may perform the following overall functions:

- 15       • Fact collection and checking 522,
- Certification generation 524,
- Maintaining revocation lists 526,
- Certificate and revocation list distribution 528,
- Authentication 530,
- 20       • Certificate renewal 532,
- Authorization 534,
- Replication 536,
- Propagation 538, and
- Archive 554.

25       Certifying authority 500 may gather evidence 502 as a basis for which to issue digital certificates 504. In this example, evidence 502 may include other digital certificates 504' (e.g., so

that one certificate can build on another). The fact collection and checking function 522 may accept this evidence 502 as well as additional trustedness data 540 (e.g., information concerning compromised or previously misused certificates). Certificate  
5 generation function 524 may generate new digital certificates 504 based upon this fact collection and checking process 522. Distribution function 528 may then distribute the new digital certificates 504, and issue bills 542 to compensate a certifying authority for undertaking the effort and liability that may be  
10 associated with issuing the certificate.

Certifying authority 500 may also maintain a revocation list 542 based on trustedness data 540 indicating, for example, certificates that have been compromised or that previously certified facts are no longer true (for example, Mr. Smith used to  
15 be a Stanford University professor but has since left the University's employ). The maintained revocation list function 526 is important for providing a mechanism to ensure that "bad" certificates cannot continue to be used once they are known to be bad. Certificates 504 issued by certifying authority 500 can  
20 expire, and the certifying authority can (for example, for a fee) renew a previously issued certificate by performing certificate renewal function 532. The certifying authority 500 may maintain a record or database of the certificates it has issued, and this database can be distributed -- which can benefit from replication  
25 function 536 and propagation function 538 to accurately and efficiently distribute the database across a number of different locations.

Figure 48 shows an example architecture for certifying authority 500. In this example, certifying authority 500 may include a secure communications facility 544, an encryption/decryption processor 546, a billing system 548, a key generator 550, a query mechanism 552, and an electronic archive 554. In this example, secure communications 544 is used to communicate with other electronic appliances 100 and/or other Commerce Utility Systems 90. Electronic archive 554 stores keys, certificates 504 and other information required to maintain the operation of certifying authority 500. Encryption/decryption processor 546 is used to create digital certificates 504 by using strong cryptographic techniques. Billing system 548 issues bills 542. Query mechanism 552 is used to query electronic archive 554. Key generator 550 is used to generate cryptographic keys the certifying authority 500 needs for its own operation.

Figure 49 shows an example certifying authority process. In this example, a publisher may send an electronic secure container 152 to a consumer 95. To use certain permissions 188a in secure container 152, the consumer 95 may require a certificate from certifying authority 500 that certifies as to a particular fact about the consumer (e.g., the consumer is a United States citizen, the consumer is a retired member of the armed forces, the consumer is over 18 years of age, etc.). The consumer may generate a request 502 to certifying authority 500 for issuance of an appropriate certificate. Certifying authority may check the evidence 502 the consumer 95 provides, or that some third party may provide, and -- once the certificate authority 500 is satisfied -

- issue the consumer the required digital certificate 504. This digital certificate 504 may be used not only with the publisher's control set 188a, but with control sets from other rights holders that require certification of the same fact and that have agreed to trust certificate authority 500 as an issuer of certificates.

Certifying authority 500 may communicate with consumer 95 using secure containers 152. It may generate and provide a control set 188b with certificate 504. This control set 188b may control some aspect of usage of the certificate 504 (e.g., it may not be redistributed and/or modified) and/or to define a chain of handling and control for the issuance of further dependent certificates (e.g., parents give authority to issue certificates about their offspring).

One certificate authority 500 may be "proxied" to issue certificates on behalf of another – such as for example in a chain of handling and control defined by one or more electronic control sets 188. Distributing the certifying authority 500 across a number of different electronic appliances has certain advantages in terms of efficiency for example. Figure 50 shows one useful example of this distributed certificate issuance scenario.

Figure 50 shows that a rightsholder 164 (and/or a rights and permissions clearinghouse 400) may request (e.g., by issuing electronic controls 188a within a secure container 152a) a certifying authority 500 to issue digital certificates 504(1) to accredited institutions of higher learning such as institution 1060. Control set 188a may establish the policies and procedures necessary to ascertain whether in fact a particular institution is

duly accredited. Based on electronic controls 188a and evidence 502 submitted by the institution 1060, the certifying authority 500 may issue a digital certificate 504A attesting to the fact of accreditation.

- 5           In order to take advantage of certificate 504A, a student, faculty member and/or staff member of institution 1060 may need to provide a further certificate attesting to the fact that he or she is affiliated with institution 1060. Instead of having certifying authority 500 issue a further certificate 504 to each student,
- 10   faculty member and staff member of institution 1060, it may be efficient and/or desirable for each institution 1060 holding a certificate 504A to issue dependent certificates 504(2) to its own faculty, staff and students. For example, institution 1060 may maintain a current list of all students, faculty and employees.
- 15   Rather than requesting certifying authority 500 to issue a separate certificate 504(1) to each student, faculty member and employee of institution 1060, the institution may undertake this responsibility itself.

- For example, institution 1060 may elect to operate its own,
- 20   distributed certifying authority 500A. In one example, certifying authority 500 may issue electronic controls 188b (subject to controls 188a issued by rights holder 164, for example) that delegate, to the institution's certifying authority 500A, the authority and responsibility to issue dependent certificates 504(2)
- 25   within certain limits (e.g., attesting to a limited universe of facts such as for example "This person is officially associated with the institution 1060"). Such dependent certificates 504(2) could, for

example, be copies of certificate 504(1) with an addendum stating that a particular person is associated with the institution 1060 and stating a particular expiration date (e.g., the end of the current academic term). The institution's certifying authority 500A may  
5 then issue such dependent certificates 504(2) to each faculty member, student and staff member on its current roster.

Recipients of certificates 504(2) may need a still further certificate 504(1) attesting to their identity. This is because certifying authority 500A issues certificates 504(2) attesting to the  
10 fact that a certain named person is affiliated with institution 1060 – not to the fact that a particular recipient of such a certificate is that person. The recipient may need to obtain this further “identity” certificate 504(1) from a governmentally operated certifying authority 500 such as a state or federal government.

15 Rightsholder 164 (and/or a rights and permissions clearinghouse 400 not shown) may issue control sets 188c for digital properties 166 that grant discounts or that provide other benefits to those who can provide a combination of valid digital certificates 504 attesting to their membership in the class  
20 “accredited higher education institution.” Each student, faculty member and staff member of the institution 1060 who has received a certificate 504(2) may take advantage of these discounts or other benefits. Figure 50A illustrates how such different digital certificates can be used to support certificate-  
25 conditional controls 188 – that is, control sets whose elements are dependent on the presence or absence of certificates 504 that attest to certain facts.

In this Figure 50A example, one or more control sets 188c include a number of discrete controls 188(1) . . . 188(N) applying to the same digital property 166 or group of properties, for example. Control 188(3) may provide additional and/or different  
5 rights to all students, faculty and staff members of Stanford University. In the Figure 50A example, multiple certificates can be used together to provide the requested certifications. For example, the certificates 504(1), 504(2), 504A shown in the Figure 50 example can be used together to allow a particular person to  
10 take advantage of a discount offered to students, faculty and staff members of accredited institutions of higher learning. For example:

- a certificate 504(1) may attest to the fact that a certain person John Alexander is who he says he is.
- 15 • another certificate 504A may attest to the fact that Stanford University is an accredited institute of higher learning,
- another certificate 504(2) may attest to the fact that John Alexander is a student at Stanford University for the  
20 current academic semester.

Each of these various certificates 504 can be issued by different certifying authorities 500. For example, one certifying authority 500 (e.g., operated by a governmental entity) might issue a certificate 504(1) certifying the consumer's identity, while  
25 another certifying authority may issue certificate 504(2) attesting as to student status, and a third certifying authority may issue the

certificate attesting to the fact that Stanford is an accredited University (see Figure 50).

As an additional example, a control set element 188(1) shown in Figure 50A may provide a certain benefit for California residents. Its condition may be satisfied by the consumer presenting a digital certificate 504(3) certifying residency (e.g., in combination with the "identity" certificate 504(1)). A still further permission 180(N) shown in Figure 50A might be satisfied by presenting a certificate 504(5) indicating U.S. citizenship. Such certificates 504(3), 504(5) that warrant that a given person is subject to one or more jurisdictions (for example, a resident of, or doing business in a particular city, state, nation, or other political unit -- and therefore, subject to that unit's sales, income, or other taxes, or subject to certain administrative fees) are particularly useful for interstate and/or international commerce transactions. For example, a certifying authority 500 might issue a certificate 504 to a financial clearinghouse 200 in the United Kingdom. This certificate 504 could be used in conjunction with control sets 188 distributed by rightsholders and/or a rights and permissions clearinghouse 400 specifying that only United Kingdom financial clearinghouses 200 are authorized to accept payment in pounds sterling. A customer wishing to pay in pounds sterling will only be able to complete the payment transaction if the financial clearinghouse being used has the appropriate UK certificate. This UK clearinghouse might then pay appropriate UK taxes -- relieving the provider from the burden of having to determine

which of his or her transactions were subject to UK tax payments and which were not.

Figure 50A also shows a further certificate 504(4) certifying that a certain person is married to a certain other person. To use  
5 certificate 504(4), it may also be necessary to present the first certificate 504(1) certifying identity. Such certificates attesting to relationship between individual people or between people and organizations are useful in allowing, for example, family members to use the certificates of other family members (e.g., a person can  
10 obtain a benefit based on his or her spouse's or parents' certified credential(s)).

Figures 51-51D show example detailed formats of various digital certificates 504. The Figure 51A digital certificate 504(1) may certify that a person is who he says he is. This certificate  
15 504(1) might include, for example:

- a field 560(1) stating the person's name,
- a field 560(2) specifying the person's date of birth,
- an expiration field 560(3) specifying when the digital certificate expires,
- 20 • a public key 560(4) corresponding to the person's public key, an ID code 560(5) (which in this example could be a hash of the public key field 560(4)), and
- a check sum field 560(6) providing an error checking ability.

25 Digital certificate 504(1) is encrypted in this example by the certifying authority 500 using the certifying authority's private key of a public key-private key cryptosystem pair, such as RSA or

El Gamal. The certifying authority 500's corresponding public key can be made public (e.g., by publishing it in several publicly accessible sites on the World Wide Web or in another widely distributed context), or it could remain secret and never be exposed outside of protected processing environments 154. In either case, successful decryption of the digital certificate 504(1) to reveal the original clear text information provides a high degree of assurance that the digital certificate was issued by certifying authority 500 (presuming that the certifying authority's private key has not been compromised).

Expiration field 560(3) is useful because people who skip checks of revocation lists have at least some assurance that a certificate is good if it must be renewed periodically. Expiration date field 560(3) provides an additional safeguard by insuring that certificates do not last forever -- allowing certifying authorities 500 to use different cryptographic key pairs for example to provide overall integrity and trustedness of the certification process. Changing the certifying authority 500's key pair reduces the incentives for an adversary to break a given key, because the amount of information protected by that key is limited, and the fraudulent use of a compromised key will only have a limited time of effectiveness. Furthermore, (currently) unexpected advances in mathematics may render some cryptographic algorithms useless, since they rely on (currently) theoretically intractable computations. A built in mechanism for changing the certifying authority 500's keys allows the impact of such breakdowns to be limited in duration if new algorithms are used for reissued

certificates (alternatively, this risk can also be addressed by using multiple asymmetric key pairs generated in accordance with different algorithms to sign and validate keys, at the cost of additional decryption time).

5           Figures 51B, 51C and 51D show additional digital certificate examples containing different sorts of information (e.g., professional credential field 560(7) in the case of certificate 504(5), address field information 560(8) in the case of certificate 504(3), and student credentials field 504(9) in the case of student  
10 certificate 504(2)). These certificates 504(2), 504(3), 504(5) are tied to identity certificate 504(1) via the common ID field 560(5), and both the identity certificate and the independent certificate would generally need to be presented together.

          Figure 51E shows how an example digital certificate issued  
15 by one certifying authority can – in conjunction with a trusted database – be the basis for another certifying authority to grant another certificate. One certifying authority 500A can, for example, validate user identity and create the identity certificate 504(1) shown in Figure 51A. The user can submit this identity  
20 certificate 504(1) to another certifying authority 500B that has a data base 554a of people and/or organizations who have a particular attribute. For example, certifying authority 500B may be operated by a professional organization that maintains an internal database 554a. Certifying authority 500B will trust the  
25 contents of this internal database 554a because the certifying authority 500B maintains it and keeps it accurate.

By comparing the identity information in the Figure 51A certificate with the contents of the trusted database 554a, certifying authority 500B can issue the Figure 51B certificate without requiring any physical evidence from the owner of the Figure 51A certificate. This solves an important problem of requiring the user to “show up” each time he needs a highly trusted certificate — and also allows the second certificate-generating the process to be automated.

Figure 51E also shows that the certificate 504(2) issued by certifying authority 500B may be (along with identity certificate 504(1)) a sufficient basis for a further certifying authority 500C to issue a further certificate 504(3) based on its own lookup in a trusted database 554b.

Another example would be a corporation that has proven its identity to the Secretary of State in the jurisdiction in which it is organized. If this corporation has passed muster to handle hazardous material it could submit its certificate of identity 504(1) from the Secretary of State (which in this case would comprise certifying authority 500A) to the agency (certifying authority 500B responsible for maintaining the database 554a of which companies are currently qualified and authorized to handle hazardous materials. The certifying authority 500B could then issue a certificate 504(2) attesting to this fact in an entirely automated way if desired.

Insert before heading on p 219 Secure Directory Services (Figure 52 shows)

**Certification to Allow Participants to Act as Agents of an Entity**

Sometimes, one or more participants in a particular value chain, or having a particular relationship with other participants, need to be authorized to act on behalf of the collection of participants. For example, several parties may wish to act based on authorization from the partnership or joint venture of which they are a member – or all participants within a particular value chain may need to act for the value chain as a whole. Each of the participants receiving such authority from the entity may need authorization from the entity to act.

The present invention provides a mechanism in which digital certificates 504 may be used to create a “virtual entity” that can grant any combination of participants any combination of the same or different powers to exercise defined powers under controlled conditions of use. More particularly, a digital certificate grants each participant in a virtual entity the power to act on behalf of the entity – within the constraints of the conditions of use and further with any consequences defined in the conditions of use specified by electronic controls associated with the container.

Figure 51F shows an example electronic container 152 that encases the following information:

a value 564 that identifies the “virtual entity,”  
signatures 566(1)-566(N) -- one for each member of the entity,  
other information 568 pertaining to the entity,

digital certificates 504(1)-504(N) – one for each member of the entity, and

control information 188 that specifies powers (e.g., rights or permissions) and “conditions of use.”

5 Value 564 provides an identifier that uniquely identifies the entity. The “other information” field 568 may provide further information concerning the entity (e.g., the name of the entity, the name and address of each participant, the expiration date on which the entity ceases to exist, and other information). Signatures

10 566(1)-566(N) are like signatures on a partnership agreement – each member of the virtual entity affixes his or her “signature” to indicate assent to be a member of the entity and assent to the conditions being granted to each participant.

Container 152 in this example further includes an electronic  
15 control set 188 describing conditions under which the power may be exercised. Controls 188 define the power(s) granted to each of the participants – including (in this example) conditions or limitations for exercising these powers. Controls 188 may provide the same powers and/or conditions of use for each participant, or  
20 they may provide different powers and/or conditions of use for each participant.

For example, controls 188 may grant each participant in a virtual entity the power to act as a certifying authority 500 on behalf of the entity. In this particular example, controls 188 may  
25 allow each party of the virtual entity to make certificates on behalf of the virtual entity – within the constraints of the conditions of use and further with the consequences defined in the conditions of

use specified by controls. As discussed above, the right to grant certificates is only an example – any type of electronic right(s) or permission(s) could be granted based on any type of electronic condition(s) of use.

5           Figure 51G shows one example process for creating the Figure 51F container 152. In this example, the parties to the virtual entity may negotiate control information governing collective action based on, for example, the electronic negotiation techniques shown in Figures 75A-76B of the Ginter et al. patent  
10           specification (Figure 51G, block 570). The resulting control information 188 specifies “conditions of use” such as the rights that may be exercised by each participant in the entity, and limitations on each of those rights (which may be defined on a participant-by-participant basis).

15           The participant initiating issuance of digital container 152 (actually, the participant’s protected processing environment 154) may select a random value for use as entity identifier value 564 (Figure 51G, block 572). The participant’s PPE 154 may next create the certificate information for the virtual entity by  
20           associating the entity identifier value 564 with other information 568 (Figure 51G, block 574). The participant’s PPE 154 may next sign the virtual entity certificate information to indicate the participant’s assent to be a member of the virtual entity and assents to the conditions of use control information 188 (Figure  
25           51G, block 576).

          The participant’s PPE 154 may then make electronic container 152, and place into it the control information 188, the

virtual entity certificate information 564, 566, 568, and the participant's own certificate 504 specifying a cryptographic key the participant may use to exercise rights (Figure 51G, block 578).

The participant may then determine whether any more  
5 participants need to be added to the entity certificate (Figure 51G, decision block 580). If yes, the container 152 may be transmitted (Figure 51G, block 582) to another participant member of the virtual entity and accessed and validated by that next participant (Figure 51G, blocks 584, 586). The next participant may similarly  
10 sign the virtual entity certificate information by adding his signature 566(2) to the list – indicating the she also agrees with the controls 188 and agrees to join the virtual entity (Figure 51G, block 588). This new information is used to add to and/or replace the entity certificate information 564, 566, 568 (Figure 51G,  
15 block 590). This next participant also adds their own certificate 504(2) to the container 152 (Figure 51G, block 592).

Steps 580-592 may be repeated until container 152 has been signed by each participant within the virtual entity ("no" exit to decision block 580). The completed container 152 may then be  
20 transmitted to all participants (Figure 51G, block 594).

Figure 51H shows an example process a virtual entity participant may use to exercise powers on behalf the virtual entity based on the controls 188 shown in Figure 51F. The Figure 51H example process is performed by the participant's protected  
25 processing environment 154 based on a request. The participant's protected processing environment 154 writes an audit record (Figure 51H, block 594a) and then evaluates the request using the

conditions of use specified by controls 188 (Figure 51H, block 594b). If the request is permitted by the controls 188 ("yes" exit to decision block 594c, Figure 51H), the participant's protected processing environment 154 accesses the virtual entity value 564 from container 152 (Figure 51H, block 594d) and uses the control information 188 associated with conditions of use to fulfill the request and perform appropriate consequences (Figure 51H, block 594e). In one example, the participant's protected processing environment 154 may act as a certifying authority 500 on behalf of the virtual entity by issuing a digital certificate 504 in accordance with the conditions of use – digitally signing the digital certificate by encrypting the entity identifier value 564 with a cryptographic key corresponding to the participant's own certificate 504 within container 152, and making the digital certificate part of the newly issued certificate. The example may then write additional audit information 594H reporting on the action it has taken.

If the requested action is not permitted by controls 188 (Figure 51H, "no" exit to decision block 594c), the example Figure 51H process determines whether the error is critical (decision block 594f). If the error is critical ("yes" exit to decision block 594f), the process may disable further use of the information within container 152 (block 594g), writes additional audit information (block 594h), and then stops (Figure 51H, block 594i). If the error is not critical ("no" exit to decision block 594f), the protected processing environment 154 writes additional audit

information (block 594h) and may then end this task (Figure 51H, block 594i).

The processes and techniques shown in Figures 51F-51H have a variety of different uses. As one example, suppose that a first publisher publishes a derivative work including his own content and content provided by a second publisher. The two publishers may form a virtual entity that allows the first publisher to act on behalf of the entity – but only in accordance with the conditions of use negotiated and agreed upon by both partners.

For example, the second publisher may be willing to allow the first publisher to republish the second publisher's content and to allow excerpting and anthologizing of that content by consumers – but only if the consumers present an appropriate certificate 504 issued by the virtual entity attesting to the fact that the consumer is permitted to exercise that right. For example, only special subscribers having certain characteristics may be entitled to receive a certificate 504. The techniques above allow the first publisher to issue certificates 504 to subscribers on behalf of the virtual entity comprising both the first and second publishers. The second publisher can be confident that the first publisher will only issue certificates in accordance with the conditions of use negotiated and agreed by both publishers.

Another example is a manufacturing process comprising multiple participants. The conditions of use provided by controls 188 may allow any of the value chain participants in the manufacturing process value chain to perform certain actions on behalf of the value chain as a whole. For example, a materials

manufacturer, a finished goods supplier and the shipping company that transports materials between them may form a virtual entity.

This virtual entity may then submit a control set to a transaction authority that describes a process that describes all three

5 participants acting in concert. For example, the control set created in accordance with the conditions of use applicable to their virtual entity might permit a unified presentation of materials requirements, finished appearance and delivery schedule, as one simple example.

10 In another example, a semiconductor company, a systems integrator, and three different suppliers of software may form a virtual entity supporting the semiconductor company's chip design, simulation, and design testing applications. In this example, certificates may be issued to each company comprising  
15 this example entity and to particular individuals within each of the companies. Rules and controls negotiated among the companies may specify who has access to which parts of the software applications and associated databases and who may make modifications to the software and/or data. In this way, the  
20 semiconductor company can authorize access to outside contractors and/or suppliers and to specific individuals representing those outside companies. These individuals may be authorized just enough access to solve typical problems and perform system maintenance tasks. Also, they may be granted  
25 additional rights (authorizations) for a limited period of time in order to resolve specific problems requiring for resolution access

to certain executables and/or data not included in their default permissions.

The virtual entity feature of the present invention represents, in part, an extension that builds upon the chain of  
5 handling and control techniques disclosed in Ginter et al. For example, certificates produced in accordance with this aspect of the present invention can use capabilities of a VDE chain of handling and control to manage a chain of certificates.

#### Secure Directory Services

10 Figure 52 shows an example of a secure directory services Commerce Utility System 600. Secure directory services may securely provide electronic and/or other directory information such as names, addresses, public keys, certificates and the like. Transmittal of such information securely (e.g., through the use of,  
15 in the preferred embodiment, the Virtual Distribution Environment) helps prevent eavesdropping, helps ensures confidentiality, and provides significant infrastructure support by enabling important participant interaction efficiencies.

In more detail, secure directory services provided in  
20 accordance with these inventions may provide the following example advantageous features and functions:

- Securely and reliably providing directory information based on a variety of different parameters, including various classification information.

- May securely provide consumer's, content provider's, clearinghouse's and/or other party's electronic address(es) and/or other communication pathway(s) based on name, function, physical location, and/or other attributes.  
5
- May provide consumer's, content provider's, clearinghouse's and/or other party's public key(s) and/or certificate(s) based on, for example, name, function, physical location, and/or other attributes.
- 10 • Protects, and where appropriate may conceal, identity related information while efficiently managing and/or automating the confidential communicating of requests and responses in secure containers.
- 15 • Using secure containers and rules and controls to guarantee integrity and non-reputability of content.
- Receiving authority from secure chain of handling and control embodied in electronic control sets.
- 20 • Distributing secure directory services functions across a network or other system (for example, every consumer and/or other value chain participant node is potentially a distributed secure directory service initiating its own, secure directory service transactions directly with one or more other

participants using VDE as described in the Ginter, et al. patent specification).

- 5                   • Granting authority and/or providing services to, or in conjunction with, one or more distributed secure directory services sub-clearinghouses whose operations may be located logically and/or physically elsewhere, such as within a company or government agency and/or within one or more jurisdictions and/or serving subsets of the overall business focus area of a  
10               senior directory service authority distributing and/or otherwise authorizing secure directly service functions across a system or network.
- 15               • Every consumer and/or certain or all other value chain participant nodes can potentially support a secure directory services authority providing naming and related services and function in the context of the overall naming services network, including  
20               interoperation with one or more other participants interoperable nodes, and as elsewhere in this list, all activities employing VDE techniques as appropriate.
- 25               • May be organized hierarchically to delegate responsibility for, and operation of secure directory services for a subset of the overall directory based on name, function, physical location, and/or other attributes.

- May be organized hierarchically to provide a directory of directories, for example.
- May be organized hierarchically, peer-to-peer, or in a combined mode where responsibility for directory services may be distributed in differing fashions for differing commerce models and/or activities and/or value chains and where certain one or more parties may be, for example, hierarchically more senior to other parties in one or more instances and hierarchically a peer or less senior in one or more other instances, that is the relationship among participants is programmable and may be set (and later modified) to one or more desired specific directory service arrangements for given commerce activities, value chains, and/or models.

Figure 52 shows an example secure directory services 600 from a process point of view. In this example, secure directory services 600 is an archive that securely keeps track of directory information relating to consumers, value chain participants and/or electronic appliances, and securely provides this information upon qualified demands. In this example, secure directory services 600 may provide the following functions:

- Database management 606,
- Database search/retrieval 608,
- Database replication 610,

- Database propagation 612,
- Authentication 614, and
- Authorization 616.

Database 606 may be accessed by search and retrieval  
5 engine 608 which takes consumer-provided input information as a  
source and uses it to retrieve records that are relevant. For  
example, secure directory services 600 may receive identities 618  
of individuals, organizations, services and/or devices; electronic  
addresses 620; certificate 622; and/or keys 624. This information  
10 may be stored in database 606.

In response to requests 602, secure directory services search  
and retrieval engine 608 may access database 606 to retrieve  
additional information (for example, the electronic mail address of  
a certain individual or organization, the public key of a certain  
15 individual, the identity of a person having a certain electronic mail  
address, the identity and address of a person having a certain  
public key, etc.).

Additionally, secure directory services 600 may return  
access controls, audit requirements and the like. For example, a  
20 user may be required to present valid credentials (e.g., a certificate  
504) to access the internal email addresses of a corporation.  
Certain fields of information known to the database 606 may not  
be available to all comers (e.g., the office location or a particular  
employee, their home directory(ies) on the company's servers,  
25 etc.; or a consumer's physical address may be available to people  
that present a certificate 504 issued by the consumer acting as his  
own certificate authority 500, but no one else. These controls can

be specified in secure containers that carry the information to the secure directory service 600.

When the information is provided to requesters, they may be required to use the information only in authorized ways. For example, they may be allowed to use the information to formulate email messages, but not excerpt a physical address for a mailing list. These restrictions can be enforced by controls 188b the secure directory services 600 associates with the information it provides.

As shown in Figure 53, secure directory services 600 may provide a database 606 and search and retrieval engine 608 in addition to a secure communications facility 626. The architecture of secure directory services 600 may be based on Figures 12 and 13 of the Ginter et al. patent disclosure.

Figure 54 shows an example secure directory service process performed by secure directory services 600. In this example, a sender 95(1) wants to send a message to a receiver 95(2). The senders and receivers could be electronic appliances 100 owned by consumers, clearinghouses, or the like. Sender 95(1) may send an address request 602 to secure directory services 600 providing certain information and requesting other information. In response, secure directory services 600 provide the requested information to sender 95(1) -- who may use the information to send a message to receiver 95(2). In this example, both the address request 602 and the responsive information 604 are contained within secure electronic containers 152 in order to maintain the confidentiality and integrity of the requests and

responses. In this way, for example, outside eavesdroppers cannot tell who sender 95(1) wants to communicate with or what information he or she needs to perform the communications — and the directory responses cannot be “spoofed” to direct the requested messages to another location. In addition, as discussed above, directory services 600 can include controls 188 along with its responses and/or request or require controls 188 as part of its input.

### **Transaction Authority 700**

Figure 55 shows an example Transaction Authority Commerce Utility System 700. These inventions also enable secure “transaction authority” capabilities providing the following overall functions:

- Securely validating, certifying, and/or auditing events (including, for example, authenticating, and, for example, for non-repudiation purposes) in an overall multi-event transaction or chain of handling and control process;
- Securely storing, validating, certifying, and/or distributing control sets (including, for example, authenticating, and, for example, for non-repudiation purposes) for multi-event transaction or chain of handling and control processes;
- Issuing requirements for any or all of the transaction and/or process steps; and

- If desired, actively participating in the transaction or process (e.g., through managing, directing, intermediating, arbitrating, initiating, etc., including participating in models employing reciprocal control methods and distributed, automated events for, for example, distributed computing, process management, EDI, reference to currency, etc.)
- Can certify steps and/or pathways, including certifying proper routing for electronic information through transaction authority telecommunication switches adapted to certify certain information and wherein certificates certify that a required route was followed and/or the sending of such electronic information was pursuant to certain stipulated rules and controls, for example acquiring certain archiving information and/or not exceeding budget and/or other limits and/or restrictions for, for example: numbers of "shipped" information containers in a given period of time, value of electronic currency contained within (represented by) a current container and/or by containers over a certain period of time, financial amount committed in purchase order, proper ordering authority, etc.

The transaction authority may simply be a secure, watchful bystander to, and certifier of, the electronic transaction and/or transaction step (in a sequence of overall transaction steps), it may be a secure facilitator of a secure plural-party electronic

transaction, and/or it may actively and directly participate in the electronic transaction.

In more detail, a transaction authority in accordance with these inventions may provide the following advantageous features

5 and/or functions:

- Securely maintaining and validating event notification information pertaining to a multi-stage transaction and/or chain of handling and control process(es).
- 10 • May enforce, through requirements for its certification or authentication, a sequence of required transaction and/or chain of handling and control processes steps based on component representation of elements of a business process, where, for example,  
15 one or more transaction authorities respectively certify and/or authenticate one or more specific events at one or more step "locations" in a transaction sequence.
- 20 • May form an overall transaction control set from a number of discrete sub-control sets contributed, for example, by a number of different participants.
- Using reciprocal methods to coordinate required transaction events, including for example, sequence of events, between value chain participants.

- Receiving authority from secure chain of handling and control embodied in electronic control sets.
- May intervene to actively manage transactions and/or chain of handling and control processes.
- 5 • Can coordinate workflow and/or chain of handling and control processes and/or other business processes.
- 10 • Can provide automatic and efficient management based on a trusted, secure distributed electronic commerce environment, including certifying and/or authenticating steps in distributed proprietary information, EDI, financial transaction, and/or trading system value chain activities that very substantially improves security for distributed rights management, wherein such security can meet or exceed the security  
15 available with centralized, online commerce models.
- 20 • May manage at least a portion of the transactions within and/or between value chain participants (e.g., organizations, individual consumers, virtual groupings).
- May specify and/or monitor, at least in part through the use of rules and controls, conditions of satisfaction for, and/or consequences of, atomic transactions.

- May direct what happens based on error conditions and/or transaction profile analysis (e.g., through use of an inference engine and/or expert system).
- 5     • Can provide confidential coordination of security, routing, prioritizing, and negotiating processes allowing different, distributed parties to work efficiently together through a confidential, trusted interface.
- 10    • Providing notarization, validation, certification, and/or delivery, as appropriate, for secure document and/or process control.
- 15    • Can certify steps and/or pathways, including certifying proper routing for electronic information through transaction authority telecommunication switches adapted to certify certain information and wherein certificates certify that a proper route was followed and the sending of such electronic information was pursuant to certain stipulated rules and controls, for example not exceeding budget or 20    other limits for: numbers of “shipped” information containers in a given period of time, value of electronic currency represented by current container and/or by containers over a certain period of time, financial amount committed in purchase order, proper 25    ordering authority, etc., are issued to satisfy

requirements regarding receiving a proper such certification or authentication at a node receiving such routed information.

- 5           • Distributing transaction authority functions across a network or other system (for example, every consumer and/or other value chain participant node is potentially a distributed usage clearing service at least in part initiating its own, transaction authority functions, and wherein said participant node may  
10           communicate usage information directly to one or more other participants) and in accordance with rules and controls and other VDE techniques as described in the Ginter, et al patent specification.
- 15           • May provide arbitration, mediation and negotiation services, electronic or otherwise.

Figure 55 shows a particular example transaction authority 700 from an overall function viewpoint. Transaction authority 700 provides, among other things, a secure auditing facility for maintaining the current state of an overall transaction or process  
20           based upon event notifications it receives from the participants in the transaction.

In this specific example, transaction authority 700 performs the following functions:

- 25           • Event notification collection 730,
- Validated event database management 732,

- Requirement generation 734,
- Secure authenticated auditing 736,
- Reporting 738,
- Notifying 740,
- 5     • Replication 742, and
- Propagation 744.

In this example, transaction authority 700 receives notifications that events have occurred in the form of event notifications 748 which may be carried in one or more secure electronic containers 152. Event notification collection process 10     730 collects these event notifications 748 and may store them in a validated event database 732. Transaction authority 700 may generate additional notifications 748' based on its validated event database 732, and may also issue responses 750 indicating the current status of a transaction or process in response to requests 15     752 and/or based on other requirements. In addition, transaction authority 700 may generate and output audit records 754 indicating the progress and status of transactions or processes based upon the contents of its validated events database 732 as analyzed by auditing function 736. Transaction authority 700 may 20     also issue reports 756 based on its reporting function 738. Validated event database 732 may be a distributed event notification database, in which case replication process 742 and propagation process 744 are used to maintain and update the 25     database in a distributed manner.

Another major function of transaction authority 700 in this example is to issue new or modified event requirements 758 that

can be used to control or influence an overall process or transaction. Transaction authority 700 may receive control set 188, prices and permissions 188', event flow requirements 760 and/or process routing requirements 762. Both event flow  
5 requirements 760 and process routing requirements 762 can be specified in one or more control sets. In response to this information and the validated event database 732 contents, transaction authority 700 may use its requirement generation process 734 to create new or modified event requirements 758.  
10 Transaction authority 700 may also create new or modified control sets 188" and new or modified prices and/or permissions 188"". Transaction authority 700 may use financial statements 764 as an input to its secure auditing function 736.

Figure 56 shows an example architecture for transaction  
15 authority 700. In this example, transaction authority 700 (which may be based on the VDE rights operating system ("ROS") architecture shown in Ginter et al. Figures 12 and 13) includes a secure communications facility 770, a database and transaction processor 772, process control logic 774, routing tables 776, and  
20 an adaptive control set database 778 (these functions could be performed by methods at one or more control sites). In addition, transaction authority 700 may also include a document notarizer 780 including a seal generator 782, a digital time stamp generator 784, and a fingerprint/watermark generator 786.

25 Secure communications facility 770 permits transaction authority 700 to communicate in a secure manner over electronic network 150 (for example, via secure electronic containers 152).

Database and transaction processor 772 performs most of the processes shown in Figure 55. Adaptive control set database 778 may perform the validated event database function. Routing tables 776 may be used as part of requirement generation function

5 734 to route appropriate messages to appropriate entities.

Process control logic 774 may include an inference engine or expert system for use in handling error conditions not fully anticipated or specified by the event flow requirements 760 and/or process routing requirements 762. Process control logic 774

10 might operate based on rule based principles, fuzzy logic, neural networks, or a combination of some or all of these -- or any other method of process control logic. Process control logic 774 determines the next event that is to occur within the overall transaction or process.

15 Document notarizer 780 may be used to provide authenticated document generation, for example, to affix digital seals and/or stenographic information to written and/or digital documents.

Figure 57 shows an example transaction authority process.

20 In this simplified example, transaction authority 700 may be an entity internal to a corporation used to securely audit and direct an overall goods delivery process. In this example, a customer 95 issues an order 788 for goods. This order 788 is received by an order receiving department 704 which issues an order event 710 to

25 transaction authority 700. In response to this order event 710, transaction authority 700 may issue rules and/or requirements in the form of one or more electronic control sets 188 specifying how

the order receiving department 704 is to handle the order. These rules 188 may specify, for example, a sequence of chain and handling that also directs the activities of a fulfillment department 709A, a warehouse 709B, a transportation company 726, and a payment collection department 709C. The rules 188—which may be passed from one department to the other within secure electronic containers 152 -- thus specifies the requirements and overall process flow of the transaction that is to occur. Each department may then pass the secure controls 188 along to the next department, with routing being directed by the rules themselves and/or by transaction authority 700. Each department may also issue event notifications 748 alerting transaction authority 700 of the current status of the overall process. Transaction authority 700 may store this status information within its secure validated event database 732 for auditing purposes and/or to permit the transaction authority to direct the next step in the process.

Transaction authority 700 can, for example, use the interaction models shown in Figures 17E-1 through 17E-4 to interaction with an ongoing transaction or process. One particularly useful scenario for transaction authority 700 is to manage a process performed by multiple parties, such as corporations working on a joint venture or other common objective. In this type of business scenario, multiple corporations may be working toward a common overall goal but may themselves have their own objectives internally such as, for example, protecting their own confidential trade secret

information. Transaction authority 700 can be used as an independent third party mediator/arbitrator to coordinate activities between the multiple corporations without requiring any of the corporations to expose detailed process information to anyone  
5 other than transaction authority 700.

For example, transaction authority 700 can generate control sets specifying event flow and/or process routing requirements 758 and/or control sets 188 that mean different things in different contexts. As an example, a control set that transaction authority  
10 700 issues might cause one corporation to perform one step and another corporation to perform another step -- with each corporation never learning the particular step or sequence of steps being performed by the other corporation. Thus, transaction authority 700 can develop control sets 188 that can be used to  
15 provide only partial disclosure between different individual or corporate actors.

Figures 58A and 58B show example steps and processes performed by transaction authority 700 to perform an "atomic transaction". In this example, transaction authority 700 performs  
20 a role that is somewhat analogous to the coach of a football team. By accepting the skill set and requirements of each individual "player" and linking them together into an overall "game plan," the transaction authority 700 can involve any number of value chain participants in an overall "atomic" transaction.

25 In this example, each value chain participant 164(1), . . . 164(N) in a process administered by transaction authority 700 could contribute a control set 188(1), . . . 188(N) specifying or

governing the participant's own business requirements, limitations and processes for the transaction (Figures 58A and 58B, block 750). These individual control sets 188(1), 188(N) specify how each individual participant performs its own role. Each participant  
5 164(1) . . . 164(N) knows its own role in the overall transaction, but may have no idea what roles others may play or have any clear idea how to form a "team" of other participants – and so these individual control sets 188(1), 188(N) typically describe only sub-transactions and may not take overall transaction considerations  
10 into account.

Transaction authority 700 also receives another control set 188X specifying how to link the various participants' control sets together into overall transaction processes with requirements and limitations (Figures 58A and 58B, block 752). This overall  
15 transaction control set 188Y specifies how to resolve conflicts between the sub-transaction control sets 188(1), 188(N) provided by the individual participants (this could involve, for example, an electronic negotiation process 798 as shown in Figures 75A-76A of the Ginter et al. patent disclosure). The transaction authority  
20 700 combines the participant's individual control sets – tying them together with additional logic to create an overall transaction control superset 188Y (Figures 58A and 58B, block 752).  
Transaction authority stores the resulting control superset 188Y in local storage (Figure 58B, block 754). This overall control  
25 superset controls how transaction authority 700 processes events to perform an "atomic" transaction.

Upon receipt of an incoming event requiring processing (Figure 58B, block 756), transaction authority 700 may activate the overall transaction control superset 188Y (Figure 58B, block 758). The transaction authority 700 may then deliver

5 corresponding reciprocal control sets corresponding to portions of the overall transaction control superset 188Y to each participant in the transaction – thereby enabling each participant to communicate with the superset (Figure 58B, block 760).

Alternatively, each participant in this example may – at the time it  
10 contributes its control set 188(1), 188(N) to transaction authority 700 -- maintain a reciprocal control set that can communicate with the control set the participant sent to transaction authority 700.

Transaction authority 700 may then begin monitoring events received using the activated control superset (Figure 58B,  
15 block 762). If the incoming event is not an error condition (“N” exit to Figure 58B decision block 764), then transaction authority 700 determines whether the event indicates that the atomic transaction is complete (Figure 58B, block 765). If the atomic transaction is not complete (“N” exit to Figure 58B, decision  
20 block 765), control returns to block 762 to monitor events. If the atomic transaction is complete (“Y”) exit to decision block 765), the transaction authority 700 determines that the transaction is finished (Figure 58B, block 774).

If the incoming event is an error condition (“Y” exit to  
25 Figure 58B decision block 764), transaction authority 700 processes the error event in the control superset 188Y (Figure 58B, block 766). If the error is not critical (Figure 58B, decision

block 767, "N" exit), then control returns to block 762 to wait for the next event notification to arrive.

If the error is critical (Figure 58B, decision block 767, "Y" exit), transaction authority 700 may call a critical error handling routine (Figure 58B, block 768). Critical error handling routine 768 may attempt to resolve the error based on the rules within the control superset 188Y and/or on an inference engine 774 or other process control logic. Such an inference engine or other process control logic 774 may be programmed concerning the business model of the overall transaction so it has enough information to select appropriate actions based on error conditions.

The process shown in Figure 58B can be nested. For example, the sub-transaction defined by one "participant" may itself be an atomic transaction based on the contributions of a number of participants -- all of which are managed by the same or different transaction authority 700.

### **Security Checkpoint Commerce Utility System**

A Commerce Utility System 90 can include service functions that enable it to perform as a "Security Checkpoint System 6000" (see Figure 58C) that provides security, archiving, and non-repudiation services that can certify and/or authenticate communicated information in certain ways. Security Checkpoint Systems 6000 can:

- provide a distributed, highly efficient, and automated auditing and archiving layer for electronic commerce interactions, and

- enhance the depth of security of a distributed security environment such as VDE and the Distributed Commerce Utility layer.

Thus, Security Checkpoint System 6000 may perform

5 security and/or administrative functions. This Commerce Utility System capability takes the positive benefits of centralized security models (e.g., ability to have a central authority physically control the processing node) and deploys these capabilities into a distributed “user space” model that can achieve maximum

10 efficiency and flexibility, support secure and manageable scalability (a principal weakness of centralized systems), and provide the enhanced security benefits of multiple, independent, secure environment layers. The latter capability is particularly adapted for highly sensitive communications desiring extra

15 security assurance. These security layers are enabled by the required participation and security processing of one or more independent security checkpoint protected processing environments that reinforces the foundation distributed security environment.

20 Information that passes through one or more Security Checkpoint Systems 6000 can be certified and/or authenticated to assure an information recipient (e.g., a party receiving information in a container) that certain communications functions and/or security steps (processes) occurred prior to receiving the

25 information. This certification and/or authentication can include, for example, certifying or authenticating proper communication routing through required and/or authorized protected processing

Security Checkpoint Systems 6000. Such checkpoints may be, for example, distributed throughout a telecommunications network, and "local" to the physical and/or logical location of end-user VDE nodes (see Figure 58C).

- 5           Security Checkpoint Systems 6000 may employ telecommunication switches adapted to certify and/or authenticate certain information and processes. For example, certificates issued by a Security Checkpoint System 6000 may certify that a required route was followed and that a required checkpoint
- 10 examined a communicated secure electronic container, and/or that the sending of such a container or other electronic information was performed pursuant to certain stipulated rules and controls. For example, such a service can help ensure and/or certify and/or authenticate, that certain budgets, other limits, and/or restrictions
- 15 are not exceeded, and/or certain other requirements are met.

- For example, a Security Checkpoint System 6000 may help ensure requirements (including that limits or other restrictions are not exceeded) for: the number of "shipped" information containers in a given period of time; the value of electronic currency
- 20 contained within (or represented by) a given container and/or by containers over a certain period of time (very important to reduce improper electronic currency activities); the financial amount committed in a purchase order, including that proper ordering authority is present; and so on. Such requirement assessment may
- 25 be in reference to, for example, container (or other digital information communication) activity communicated from a certain logical and/or physical area, node, node group, user or user

organization, and/or other user grouping, wherein said reference is determined through referencing secure node and/or individual user and/or organization and/or area identification information as, for example, a VDE secure container travels through said adapted one  
5 or more telecommunication switches.

These Commerce Utility System "communications checkpoint" capabilities can provide useful security features by, for example, providing one or more "independent" distributed security "check points" along a telecommunication route that  
10 substantially increases security reliability by requiring the presence of a proper certificate and/or authentication securely provided by such checkpoint and securely associated with and/or inserted within said container by a process managed by said checkpoint (or a group of checkpoints). This presence can be  
15 tested by a receiving node -- and a proper certificate or authentication can be required to be present, for example according to rules and controls, before such receiving node will process at least a portion of the content of one or more classes of received containers. Such container classes may include, for  
20 example, containers from specific individuals and/or groups and/or containers and/or container contents that have certain one or more specific attributes.

Security Checkpoint Systems 6000 may be "independent" of end-user Virtual Distribution Environment nodes from a  
25 security perspective. Such nodes may, for example, be independent from a security perspective because they use key management to maintain multiple secure execution compartments

within their protected processing environments for checkpoint management, such that a security breach in end-user nodes shall not directly comprise the security of checkpoint operation, and to help ensure that a breach related to a secure execution

5 compartment will not comprise other such compartments.

Security Checkpoint Systems 6000 may also gather audit information including, for example, retrieving identity information of intended container recipient(s), class(es) of container information, checksum and/or other information employed for  
10 future validation (e.g., non-repudiation), and/or archiving of some or all portions of said container's content. Some of this information may be at least in part in encrypted such that one or more portions of such information may not be decrypted without the cooperation of one or more of the container sender, the  
15 intended and/or actual container recipient(s), and/or a government body having authority to access such information.

Figures 58C and 58D show an example of a "checkpoint security" Commerce Utility System 6000 arrangement that provides communication checkpoint security, non-repudiation,  
20 and archiving services within the context of a telecommunications network connecting users 95(1), 95(2), 95(3). In this example, the security checkpoint systems 6000 may be part of the telecommunications infrastructure. For example security checkpoint systems 6000 may be part of one or more  
25 telecommunications switches or other equipment that has been designed to detect secure electronic containers 152 based, for example, on the header information they contain.

Security checkpoint systems 6000 in this example have the secure ability to control whether or not a secure container 152 transmitted through the communications infrastructure will be permitted to pass – and the consequences of routing the container through the communications infrastructure. In one example, controls operating with a user 95(1)'s protected processing environment may require certain kinds of containers 152 (e.g., containers that carry electronic currency) to include controls 404 that require them to be routed through a security checkpoint systems 6000 (or a certain class of security checkpoint systems). Such controls 404 can prevent the container 152 or its content (e.g., currency it contains) from being used unless it is routed through the appropriate security checkpoint system 6000.

For example, suppose that user 95(1) wishes to send a secure container 152 to user 95(2). In this example, the user 95(1) transmits the container 152 to user 95(2) through the telecommunications infrastructure. That infrastructure may detect that the information being sent is a container, and may route the container for interception by the a security checkpoint system (system 6000(5), for example).

Security checkpoint system 6000(5) may, after intercepting the container 152, examine the control information within the container to determine whether requirements for further communicating the container to user 95(2) have been satisfied. Security checkpoint system 6000(5) may forward the container to user 95(2) only if those requirements have been met – or it may modify the container to permit user 95(2) to open and use the

container subject to the container's controls 404 (which may limit use, for example). The security checkpoint system 6000 may be authorized to modify at least a portion of the container's controls 404 – for example to add further use limitations.

5           This Figure 58C example shows two “webs” of security checkpoint systems 6000. In this example, these “webs” represent collections of security checkpoint systems 6000 that have each been certified (by a Certifying Authority 500 for example) as being:

- 10           (1) a security checkpoint system, and  
              (2) a member of the particular class.

Hence, in this example “web 1” represents the class of certified security checkpoint systems 6000(1)- 6000(5), 6000(7); and Web 2 represents the class of security checkpoint systems  
15   6000(4)-6000(6). As one example, “web 1” security checkpoint systems 6000 may be certified as being capable of handling containers containing electronic currency 6004.

One of the requirements specified within the control information associated with the container 152 may be that it must  
20   pass through a “web 2” security checkpoint system (e.g., system 6000(5)) – for example, to enable certain secure auditing functions such as trusted electronic currency tracking. A “web 1” security checkpoint system (e.g., system 6000(3)) may refuse to pass the container 152 to user 95(2) based on these controls 404 – or it may  
25   refuse to modify the container 152 to make it usable by user 95(2).

By way of further example, suppose user 95(2) wishes to pass the container 152 along to another user 95(3). The controls

404 associated with the container 152 may require, in this particular example, that further communication of the container 152 must be through a “web 1” security checkpoint system 6000(7). This routing requirement may be present in the controls 404 provided by user 95(1), or it may be added by security checkpoint system 6000(5) or the user 95(2)’s protected processing environment.

In the particular example shown, the controls 404 may enable the “web 1” security checkpoint system 6000(7) to pass the container 152 along to user 95(3) via a further routing that does not include a security checkpoint system 6000 (e.g., via another type of commerce utility system and/or a non-secure telecommunications switch).

Figure 58D shows an example process performed by an example security checkpoint system. In this example process, the security checkpoint system 6000 receives a container 152 (Figure 58D, block 6002) and determines whether the requirements specified by its associated controls 404 have been satisfied (Figure 58D, decision block 6004). If the requirements have been satisfied, the security checkpoint system 6000 may perform “requirements satisfied” consequences, e.g., modifying controls 404 to satisfy the routing requirement mentioned above (Figure 58D, block 6006). If the requirements are not satisfied (Figure 58D, “N” exit to decision block 6004), the security checkpoint system may perform “requirements not satisfied” consequences (Figure 58D, block 6008).

Each set of consequences may involve some form of secure auditing, for example. If the security checkpoint 6000 passes a container 152 containing electronic currency for example, the security checkpoint 6000 may record one or more of the following

5 auditing information:

- sender identity,
- sender node identity,
- receiver identity,
- receiver node identity,
- 10 • certificate(s) on which the currency is based,
- other security checkpoints 6000 the currency has passed through,
- the identity of prior handlers of the currency,
- date, time, and location of transmission,
- 15 • date, time, and location of receipt,
- how long the currency has been in transit, and
- other secure auditing information.

If the security checkpoint system 6000 refuses to pass and/or modify a container 152, it may produce an audit report  
20 including available tracking information, for example:

- sender name,
- nature of deficiency,
- intended receiver, and
- other tracking information.

25 It may also notify the sender, the intended receiver, a government agency, or other authority. It may further charge a "failed communication" overhead fee to the sender, for example.

The security checkpoint system 6000 may then determine whether additional communications are required (Figure 58D, decision block 6010). If not, the process may complete. If additional communications are required ("Y" exit to decision block 6010), the security checkpoint system 6000 may transmit the container 152 to the next system (Figure 58D, block 6012). The next system may be an additional security checkpoint system 6000 that performs additional processing (Figure 58D, blocks 6016, 6004, 6006, 6008).

10

## **EXAMPLES**

### **Example – Electronic Content Distribution Value Chain**

Figure 59 shows how example Distributed Commerce Utility 75 can be used to support an example electronic content distribution value chain 162. In the Figure 59 example, an author 164 may create a valuable work, such as a novel, television program, musical composition, or the like. The author provides this work 166 (for example, in electronic digital form) to a publisher 168.

20       The publisher may use his own branding, name recognition and marketing efforts to distribute the work to a consumer 95. The publisher 168 may also provide the work 166 to a content "aggregator" 170 -- someone who provides customers access to a wide range of content from multiple sources. Examples of  
25       aggregators include, for example, traditional on-line information database services and World Wide Web sites that host content

from many diverse sources. Typically, consumers use an aggregator's services by searching for information relevant to one or more consumer-defined topics. An aggregator 170 may provide the search tools to the consumer 95 who will make their own  
5 selections.

The aggregator 170 might distribute the work 172 containing some or all of the original work 166 directly to consumer 95. Aggregator 170 may also distribute the work 172 to a "repackager" 174. Repackager 174 may, for example, take  
10 content from several sources on related matters and combine them into mixed source products, such as multimedia combinations, newsletter publications, or "current awareness" packages. In these services, the repackager makes the selection of content and organizes based on audience-indicated interest. A consumer 95  
15 may subscribe to an electronic newsletter on a particular topic or the consumer may give the repackager 174 a short list of topics they are interested in. The repackager 174 will select relevant information and communicate the information to the customer. Here the repackager is doing the selecting for the consumer.

20 For example, repackager 174 might be the publisher of a newsletter and might republish some or all of the author's work 166 in this newsletter 176. Repackager 174 could directly distribute newsletter 176 to consumer 95, or the newsletter could pass through still additional channels. Repackager 174 could use a  
25 search engine provided by aggregator 170 to find articles of interest to consumer 95 and combine those articles into an electronic newsletter that has both the aggregator 170's brand and

the repackagers 174's brand, and then send the newsletter to the consumer 95.

Distributed Commerce Utility 75 may support the Figure 59 value chain in a number of ways. For example:

5           1. Certifying authority 500 can issue certificates that allow each of the value chain participants to identify who they are and to demonstrate that they are members of one or more particular classes. For example, author 164 and/or publisher 168 might specify that any certified aggregator or repackager is entitled to  
10 excerpt or anthologize work 166 so long as appropriate payment is made. Certifying authority 500 could issue digital certificates 504 supporting this desired business objective, the certificates certifying that aggregator 170 is in fact a reputable aggregator and that repackager 174 in fact a reputable repackager. So long as  
15 author 164 and/or publisher 168 trust the security of the overall system 50 and the certificates 504 issued by certifying authority 500, they will have no fear that the work 166 will be excerpted or anthologized by anyone other than the appropriate types of people they specify.

20           In another example, certifying authority 500 could issue a certificate 504 to aggregator 170 or other user. Certifying authority 500 could issue this certificate 504 at the direction of author 164 or publisher 168. The certificate 504 may attest to the fact that author 164 or publisher 168 agree that aggregator 170 or  
25 other user is authorized to modify certain permissions 404. Author 164 or publisher 168 may have specified permissions 404

so that that will allow themselves to be modified only on the condition that an “authorized aggregator” certificate is present.

In another example, certifying authority 500 could issue a certificate to one or more classes of users, enabling, for example, utilization of content and/or specific portions of content and/or modification of permissions, which such enabling may be limited to specific utilization and/or modification by employing certain VDE rules and controls put in place by the author or publisher or certificate authority (as allowed by in place rules and controls).

10        2. Rights and permissions clearinghouse 400 in this particular example may be used to register work 166 and issue appropriate permissions 404 consistent with authorizations and instructions provided by each value chain participant. For example, the author 164 could register work 166 with rights and permissions clearinghouse 400, and specify an electronic control set 404 defining the rights of every other value chain participant.

For example:

- 20        • This control set 404 could specify, as one example, that publisher 168 can distribute an unlimited number of copies of the work 166 so long as the publisher pays the author 164 a certain dollar amount for each copy distributed.
- 25        • The control set 404 might permit publisher 168 to add his own additional controls that allow consumer 95 to read the work 166 an unlimited number of times but prevents the consumer from copying or redistributing the work.

- Although the electronic control set may travel in an electronic container 152 with the work 166, it may also be provided separately. For example, rights and permissions clearinghouse 400 might, upon request,  
5 supply a control set associated with work 166 to anyone who requests a control set.

Rights and permissions clearinghouse 400 might maintain different versions of the control set 404 for different user classes so that, for example, consumers 95 might receive one control set  
10 404a, aggregators 170 might receive another control set 404b, and repackagers 174 might receive a still further, different control set 404c. Each of these control sets can be provided in advance by author 164 or other rights holders, providing a “pre-approved permissioning” system that makes widespread usage of work 166  
15 extremely efficient and yet highly secure, and further, such control sets may interact with VDE distributed template applications in a seamless manner -- one or more template applications may be distributed with a control set by such distributors of such control sets (or may be otherwise made available) to such control set  
20 recipients. In one particular “superdistribution” business model, work 166 is allowed to be distributed as widely as possible, and rights and permissions clearinghouse 400 does the work of providing current control sets 404 authorizing particular value chain participants to use the work in particular ways under  
25 particular conditions.

3. Usage clearinghouse 300 in this particular example may support the value chain by collecting usage information from each

value chain participant. The usage clearinghouse 300 may thus provide a secure auditing function, generating, for example, reports that track how many times the work 166 has been used and how it has been used.

5           As one example, usage clearinghouse 300 might analyze usage information to determine how many consumers 95 have read the work. Usage clearinghouse 300 can, for example, report consumption information in varying amounts of detail and/or specific kinds of information, to various value chain participants  
10 consistent with privacy concerns and the accepted business rights of each party. As one example, the usage clearinghouse 300 might give consumer 95 a very detailed report about his or her own particular usage of work 166, while providing author 164 or publisher 168 with only summary report information that may, for  
15 example, not include the consumer name, address, or other direct, identifying information.

As another example, reports could also flow directly from the repackager 174 to the aggregator 170, publisher 168 and author 164. Reports may be directed along any logical pathway,  
20 directly, or through any sequence of parties, and containing whatever mix of information for each party as is acceptable to the value chain and as may be enforced, for example, at least in part by VDE rules and controls

4. Financial clearinghouse 200, in this example, may  
25 provide secure clearing of financial details of the transaction -- ensuring that appropriate value chain participants compensate other appropriate value chain participants. As one example,

financial clearinghouse 200 may receive payments from consumer 95 based on the consumer's use of work 166, and distribute parts of the payments appropriately to author 164, publisher 168, and other appropriate value chain participants in an automated, efficient process managed at least in part by VDE rules and controls. For example, financial clearinghouse 200 might interface with other banks or financial institutions to accomplish an automation of payment transfers, and/or it might assist in managing electronic money maintained within the overall value chain shown. Financial clearinghouse 200 may also assist in ensuring that itself and the other Commerce Utility Systems 90 are appropriately compensated for the administrative and support services they provide, that is, for example, secure VDE processes operating within Commerce Utility Systems 90 may automatically ensure the payment to such administrative and support service providers.

5. Secure directory services 600, in this example, may support the example value chain by facilitating electronic communications between value chain participants and/or between Commerce Utility Systems 90. For example, secure directory services 600 can, upon request, provide electronic address and/or routing information allowing one value chain participant to electronically contact another. As one example, suppose a consumer 95 wants to obtain the latest addition of work 166 but discovers that the electronic address of publisher 168 has changed. Consumer 95 can electronically contact secure directory services 600, which can provide current address information. Of course, in

commercial trading system applications, for example, secure directory services may provide much more elaborate services for the identification of desired parties, such as multi-dimensional searching of directory resources for identifying parties based on class attributes. Secure directory services 600 may also provide services that enable the identification of content, for example based upon content type and/or rules and controls associated with such content (pricing, allowed usage parameters such as redistribution rights, etc.).

6. Transaction authority 700 in this example might be used to assist repackager 174 in developing newsletter 176. For example, transaction authority 700 might help in automating a process in which a number of different works created by a number of different authors were all aggregated and excerpted for publication in the newsletter. Transaction authority 700 can securely maintain the current status of an overall multi-step process, specifying which steps have already been performed and which steps have yet to be performed. Transaction authority 700 can also, for example, help arbitrate and mediate between different participants in such a multi-step process, and can in some cases actively influence or control the process (for example, by issuing new instructions or requirements based upon error or other conditions).

#### **Example -- Manufacturing Chain**

Figure 60 shows an example manufacturing value chain supported by Distributed Commerce Utility 75. In this particular

example, a customer 95 places an order with a manufacturer 180 and receives an order confirmation. The manufacturer may order parts and supplies from a number of different suppliers 182(1)-182(N). Suppliers 181(1)-182(N) may, in turn, order additional parts or sub-assemblies from additional suppliers 182(a1), . . . . A bank 184 may supply funds to suppliers 182 based on proofs of order and assurances that the manufacturer will pay back the advances. A transportation/warehousing company 186 may provide transportation and warehousing for supplies and/or final products.

In this value chain, certifying authority 500 and transaction authority 700 can assist with secure flow of electronic orders, confirmations, terms and conditions, and contracts, and can also help to ensure that each value chain participant can maintain the desired degree of confidentiality while exchanging necessary information with other value chain participants. Usage clearinghouse 300 may assist in secure auditing of the overall process, tracking of physical and electronic parcels between the value chain participants, and other usage related operations.

Financial clearinghouse 200 may handle the financial arrangements between the value chain participants, for example, assisting in coordinating between the world of electronic network 150 and a paper-oriented or other world of bank 184. Rights and permissions clearinghouse 400 may provide a secure archive for electronic controls 404 defining parts or all of the transaction. Transaction authority 700 may securely monitor the overall progress of transactions occurring among value chain participants,

and provide periodic status reports as appropriate to each value chain participant. In addition, transaction authority 700 can assist in directing or arbitrating the overall transactions to ensure that all steps and requirements are fulfilled. Secure directory services 600  
5 can assist in routing information electronically between the different value chain participants. Of course, as previously stated for the present inventions and as applicable throughout this specification, VDE chain of handling and control and other capabilities, including rules and controls and secure  
10 communication techniques, would preferably be used as a foundation for the above activities.

**Examples of How Commerce Utility Systems Can Support One Another**

15           Figures 16A-16E described above show how different Commerce Utility Systems 90 can support one another. In more detail, Figure 16A shows that a financial clearinghouse 200 may provide services to one or more other Commerce Utility Systems 90, including, for example, the usage clearinghouse 300, the rights  
20 and permissions clearinghouse 400, the certifying authority 500, the secure directory services 600, the transaction authority 700 and another financial clearinghouse 200'. Under such circumstances, the plural Commerce Utility Systems constitute both a virtual clearinghouse and a higher order Commerce Utility System.

25           In each instance, the financial clearinghouse 200 may collect funds due the support services and deposit these funds to at least one provider account employing at least one payment

method. The financial clearinghouse 200 may also provide VDE audit records confirming the source and amount of the funds and the provider account in which the funds were deposited by the financial clearinghouse 200. The financial clearinghouse 200 may  
5 provide assistance to one or more other support services in establishing provider accounts and communicating to such one or more support services the account number and/or numbers and terms and conditions that may apply. Both the support service request to the financial clearinghouse 200 and its responses to the  
10 requesting support service can be communicated in VDE secure containers (as mentioned earlier) to take advantage of their substantial security, confidentiality, flexible control architecture, and trustedness, and can be processed at each location by one or more VDE Protected Processing Environments. Financial and  
15 account information may be provided in the form of VDE control sets and/or be incorporated in VDE control sets by the financial clearinghouse 200 and/or by one or more other support services. Financial clearinghouses 200 may also provide services to each other to promote further operating and administrative efficiencies.  
20 For example, one financial clearinghouse 200 may provide services to its counterparts in other countries or in other geographic regions. In another example, one financial clearinghouse 200 may provide another financial clearinghouse 200 access to one or more payment methods not directly supported  
25 by the second financial clearinghouse 200.

Figure 16B shows that the usage clearinghouse 300 may also provide services to other Commerce Utility Systems 90. In

one example, the usage clearinghouse 300 may provide raw data, aggregated data, at least in part derived information, and/or reports to other electronic commerce support services such as financial clearinghouses 200, rights and permissions clearinghouses 400, 5 certifying authorities 500, secure directory services 600, transaction authorities 700, and other usage clearinghouses 300'. These other infrastructure services may use this information as independent third party verification of certain transactions and their details, for market research on behalf of their own services, 10 and/or to resell this information, perhaps in conjunction with their own usage information. In one example, a rights and permissions clearinghouse 400 might sell reports to a publisher containing a combination of their own information, and that from the financial clearinghouse 200 and usage clearinghouse 300 plus secure 15 directory service 600 and certifying authority 500. More specifically, a report might contain a list of objects registered at the rights and permissions clearinghouse 400 by a particular publisher, the number of requests to the rights and permissions clearinghouse for updated or additional rights and permissions, 20 financial clearinghouse 200 summary revenue numbers for each digital property, the number of certificates by the certifying authority 500 on behalf of the publisher indicating that the user had been certified and had a valid subscription to the publisher's digital works, and the number of requests to the secure directory 25 service 600 seeking information about the network addresses of the publisher's online web servers. In each case, a support service

provided the information to the rights and permissions clearinghouse for incorporation in this report to the publisher.

**Example – Distributed Commerce Utility 75 Can Support Digital Property Purchasing, Licensing and/or Renting Transactions**

5 Distributed Commerce Utility 75 provides significant trustedness, security, convenience, and efficiencies for instances in which customers pay for digital information. Moreover, information creators and distributors can price this information—  
10 indeed, any digital property in any digital format—in various ways and in different ways in different markets.

Figure 61 shows an example of an information delivery service arrangement 1000 in which an information provider 168 provides electronic content for purchase, rental and/or licensing.  
15 In this example, an information services company 168 distributes information 166 to several global markets, including individuals, Their market areas include professionals, home office users, and the small office marketplace, as well as medium and large companies and consumers at home. For example, provider 168  
20 may deliver content 166 in electronic form to a home consumer 95(1), a professional such as a lawyer 95(2), and to a corporation or other organization 95(3). In one example:

- an individual consumer 95(1) buys under subscription pricing three articles 166(1) from an online  
25 encyclopedia;
- a lawyer 95(2) buys three chapters 166(2) from a treatise on patent law; and

- two product marketing managers in a large company 95(3) receive a proprietary market research report 166(3).

Prior to information delivery transactions, the consumer 95(1), professional 95(2) and company 95(3) may use a secure directory service 600 to locate the network address of the information provider 168 as well as assist in identifying the content they wish to work with. Subsequently, these parties 95 may send an electronic message to provider 168 requesting the specific information they want to receive. Provider 168 may deliver this information 166 within VDE secure electronic containers 152 along with associated rules and controls 188 that control pricing and permissions. Each of parties 95 has an electronic appliance 100 including a protected processing environment 154 that enforces these controls 188.

The provider 168 can price information differently for different markets. For example:

- professionals 95(2) and SOHO (small office/home office) pay transaction fees;
- large companies 95(3) pay a mixture of subscription and transaction fees (e.g., company 95(3) may pay \$10 per page printed or excerpted from a larger report, and may also pay a subscription fee); and
- Individual consumers 95(1) pay a flat subscription rate.

In each of these cases, local, state, and/or federal sales taxes, as appropriate, are included in the retail price. Payment methods may be provided within electronic control sets 188 delivered in electronic containers 152 with, and/or independently of, the  
5 associated content 166 (for example, as provided in Ginter, et al).

A financial clearinghouse 200 ensures that provider 168 receives payment through any authorized payment method. The information delivery service 168 accepts a broad range of payment methods. Some forms of payment are more popular in certain  
10 markets than in others. For example:

- In the professional, SOHO, and consumer markets, credit (MasterCard and Visa) and charge (American Express) are popular.
- Consumers 95(1) also like credit cards, and are  
15 making increasing use of bank debit cards.
- Large companies 95(3) also use credit and charge cards, payment through Automated Clearinghouses (ACHs), and billing and payment through traditional and VDE secure Electronic Data Interchange (EDI)  
20 transactions based, for example, on X.12 protocols.

A financial clearinghouse 200 makes payment more efficient in several ways. For example, financial clearinghouse 200 furnishes provider 168 with a convenient, "one stop shopping" interface to the several payment methods, and keeps track of the at  
25 least one account number associated with a given provider.

In this particular example, a certifying authority 500 may deliver digital certificates to each of consumers 95 specifying a consumer's one or more classes. For example, certifying authority 500 may deliver:

- 5           •     one or more certificates 504(1) attesting to the fact  
                  that consumer 95(1) is an individual consumer  
                  subscriber to information service 1000 and further  
                  attesting to the fact that the consumer is a registered  
10           college student and is a resident (for the taxation  
                  purposes related to the transaction) of California,
- a certificate 504(2) attesting to the fact that  
                  professional 95(2) is a lawyer admitted before the bar  
                  of the State of California, and
- 15           •     one or more certificates 504(3) attesting to the fact  
                  that corporation 95(3) is a legally incorporated entity  
                  and has a certain credit worthiness.

Control sets 188 may activate the different payment methods based on the presence of an appropriate digital certificate 504. For example, control set 188(1) delivered to consumer  
20   electronic appliance 100(1) authorizes consumer 95(1) to use each  
of the three articles 166(1). Control set 188(1) may, for example,  
contain a requirement that the consumer 95(1) must have a  
certificate 504(1) from an independent certifying authority 500 (or  
from the information distributor or other party acting in a  
25   certifying authority capacity under authorization from a more  
senior certifying authority) attesting to the fact that the consumer

95(1) has a subscription that has not yet expired to the online encyclopedia. This certificate 504(1) may, for example, be used in conjunction with other certificates issued by the certifying authority 500 (e.g., perhaps run by, or authorized by, the US government or other governing body) attesting to the fact that the consumer 95(1) is a US citizen, resides within the US, and is a legal resident of the State of California.

### **The Individual Consumer**

The consumer 95(1) pays the information provider 168 for the subscription through a transaction transmitted to the financial clearinghouse 200 in a VDE electronic container 152. The payment transaction may involve, for example, the consumer appliance 100 sending to financial clearinghouse 200 an electronic container 152(7) including rules and controls 188(4) and audit records 302(1). The audit records 302(1) may indicate, for example:

- who should be paid,
- the amount of the transaction,
- the particular payment method (a VISA card, for example),
- the subscriber's VISA card number and expiration date,
- an identifier of the information subscription, and
- the number of the provider's account to which the payment should be credited.

The secure container 152(7) may also contain rules and controls 188(4) indicating that municipal, California and US federal sales taxes should also be collected. The financial clearinghouse 200 collects the appropriate sales taxes and deposits the funds in the appropriate accounts, for example certain funds would be deposited in the account belonging to the appropriate State of California tax collection agency 1002.

In exchange for the payment, the subscribing customer 95(1) may receive from certifying authority 500 a certificate 504(1) indicating she is in fact a subscriber and the expiration date of the current subscription.

### **The Professional**

The lawyer 95(2) in this example may be located in the United Kingdom. He purchases the three chapters 166(2) from a treatise on patents using a MasterCard, but pays in pounds sterling rather than in dollars. To perform the purchase transaction, the lawyer 95(2) may first be preauthorized by the financial clearinghouse 200 for purchases each month of up to \$500 US (or the equivalent in pounds). The pre-authorization may be sent from the financial clearinghouse 200 to the lawyer's appliance 100(2) in the form of a budget control 188(5) in a secure container 152(8). The protected processing environment 154(2) within the lawyer's appliance 100(3) may open the container 152(8), authenticate the budget record 188(5), and store the control within an associated secure database maintained by PPE 154(2).

Upon receiving opening each of the three chapters 166(1), the lawyer's protected processing environment 154(2) may create an associated audit record, and may decrement available credit in the budget record by the amount of the purchase. At month end,  
5 or when the \$500 preauthorized credit has been exhausted, the lawyer's PPE 154(2) may send to the financial clearinghouse 200, a secure container 152(9) with audit records 302(2) indicating all the purchases, their amounts, and the provider account or accounts to be credited, this supporting efficient automation of clearing  
10 processes. The financial clearinghouse 200 may open the secure container 152(9), debit the lawyer's credit card account, and pay the appropriate provider accounts their due.

### **The Company**

Preliminary to content transactions, a distributed corporate  
15 financial clearinghouse 200A within the company 95(3), while operating under the authority of the financial clearinghouse 200, sends to each of managers 95(3)A, 95(3)B a secure container 152 a budget record 188 indicating their currently approved monthly information and market research budget. A corporate distributed  
20 certifying authority 500A (in the same trust hierarchy as the certifying authority 500, in this example) may also issue digital certificates 504 (not shown) to employees of the company.

In this example, each product manager 95(3)A, 95(3)B prints selected portions of the report and the budget on his or her  
25 local appliance 100, which is decremented by \$10 for each page printed. The protected processing environment 154(3) within the

local electronic appliance 100(3) securely performs this process, conditioning it on controls 188(3) that may require appropriate digital certificates 504(3) issued by certifying authority 500 and/or the distributed corporate certifying authority 500A.

- 5           According to controls 188(3) supplied by the information provider, for example, at the end of the month, or when the budget for that month is exhausted, the corporation's appliance 100(3) sends to the corporate internal financial clearinghouse 200A audit records (not shown) indicating any purchases that might have been
- 10   made during the reporting interval and the amounts and provider account numbers for those purchases. The distributed, local corporate financial clearinghouse 200A aggregates the sums in the audit records and sends in a secure container 152(12) at least one audit record 302(3) to the external financial clearinghouse 200 to
- 15   authorize payment of the total amount owed the provider of the market research reports through an Automated Clearinghouse (ACH). Also in the secure container 152(11) (e.g., as part of audit record 302(3)) are the account number of the company 95(3) from which the funds should be debited and the account number of the
- 20   market research company that issued the report into which the funds should be credited. The financial clearinghouse 200 completes the payment process through the ACH and sends a VDE secure container (providing at least one audit record) back to the internal, corporate financial clearinghouse 200A as confirmation.
- 25   Distributed clearinghouse 200A may, in turn, send, using a secure container (not shown), at least one confirming audit record to each of the product managers 95(3)A, 95(3)B.

**Example: Distributed Commerce Utility 75 Can Support Transactions Where A Consumer Purchases and Pays For A Tangible Item**

A significant portion of electronic commerce will entail the sale, purchase, distribution management, and/or payment for intangibles of all kinds. Commerce in tangibles has many of the same security, trustedness, and efficiency requirements as commerce in intangibles (e.g., digital information). For the computer to become a true commerce appliance, a distributed, secure, trusted rights/event management software layer (e.g., rights operating system or middleware) such as the Virtual Distribution Environment described in the Ginter et al. specification is a necessity. Thus, even when tangibles rather than digital properties are the object of secure electronic commerce, Distributed Commerce Utility 75 can play an important role.

Figure 62 shows an example tangible goods purchasing and payment system 1010. In the Figure 62 example, imagine a well-known provider of clothing and certain related household items, for example, L.L. Bean or Lands' End, offers their wares over a digital network such as the Internet/World Wide Web. In this example, the company creates:

- a Web catalog server 1012 to offer a line of clothing to consumers 95,
- a web fulfillment server 1014 that is an interface to the fulfillment function, and
- a third web server 1016 that acts as a secure financial clearinghouse 200 and as an interface to several

payment methods (e.g., MasterCard ("MC"), VISA, and American Express ("AMEX")).

The company also in this one example

- 5           • registers the service with the secure directory service provider 600, and
- through the financial clearinghouse 200, establishes a provider account with at least one payment method, such as a credit card, debit card, and/or bank, and
- 10          • registers several transactions with a transaction authority 700.

15           In this example, the company registers with the transaction authority 700, which may be a distributed transaction authority within the company selling the goods, an atomic transaction comprising at least one electronic control set that describes, for example:

- sending the order to the fulfillment processing one or more organizations such as a warehouse 1018 and logistics 1020 (which may or may not be the same company),
- 20          • receiving confirmation that the desired merchandise is in fact in stock,
- receiving confirmation of the order,
- receiving payment pre-authorization from a payment method for the particular customer placing the order,
- 25          • shipping instructions for the merchandise,

- confirmation that the merchandise was actually shipped, and
- controls for completing the payment transaction.

In this one example, the company also obtains at least one  
5 digital certificate 504 from a certifying authority 500 attesting to  
at least one fact, for example, that

- the company is a legitimate corporation registered in the State of Delaware;
- the company is not in bankruptcy and/or the company  
10 has a certain degree of creditworthiness,
- the company has been assigned a particular Federal tax Identification Number, and
- that the company has State tax Identification  
Numbers in each of several states, the specific states  
15 and their corresponding Identification Numbers,

A customer 95 uses his or her electronic appliance 100 with  
Web browsing capabilities to access the catalog server 1012 over  
the Internet's World Wide Web. The catalog server 1012 sends  
the customer 95 a web page 1022 providing a page from an  
20 electronic catalog. Web page 1022 may be sent in one or more  
secure electronic containers 152(1). The customer 95 displays the  
web page 1022A using his or her electronic appliance 100, and  
clicks on the part of the web page showing a men's short sleeve  
Oxford button down shirt selling for \$15.95. The current Web  
25 page is replace by a web page 1022B from the fulfillment server

1014. This second web page 1022B may be sent in a secure container 152(2).

The customer's electronic appliance 100 has a protected processing environment 154. PPE 154 opens the secure container  
5 152, and displays the page 1022B on the screen. The page 1022B being displayed is a form that has several fields including the catalog number and description of the shirt and retail price. The customer 95 fills in fields for color, neck size, normal or tall person, normal or trim fit, and quantity. The customer 95 also  
10 indicates where the shirt(s) are to be delivered, the class of delivery service desired, and the customer's address.

Upon the customer 95 completing the required information, the electronic appliance 100 puts the form field information 1024 in a secure container 152(3) and sends the container back to the  
15 fulfillment service 1014. Fulfillment server 1014 opens the container 152(3) and reads the field information 1024. Fulfillment server 1014 creates a VDE audit record indicating receipt of information 1024. Fulfillment server 1014 may also create a control set 188 and/or an event notification that initiates a  
20 purchase transaction.

Fulfillment server 1014 may communicate with warehouse 1018 directly or through transaction authority 700. The fulfillment server 1014 then determines whether the required items are in stock and available to be shipped. If fulfillment server 1014  
25 determines that the required items are in stock and available to be shipped, and if the information 1024 provided by the consumer is

sufficient to proceed, the fulfillment service sends back to the consumer another Web page 1022C indicating:

- that the purchase can be fulfilled,
- what are the various sales taxes and delivery charges,
- 5     • the address provided and class of delivery service chosen,
- new fields for payment related information, and
- a query asking whether the consumer wishes to proceed.

10           The fulfillment service 1014 also sends audit records 302(1) to the consumer's PPE 154 and to the transaction authority 700 indicating which parts of the larger, atomic transaction have been fulfilled.

          If the customer 95 determines he or she does not wish to  
15     continue with the transaction after viewing fulfillment details,, his or her appliance 100 can send a secure VDE container 152(5) to the fulfillment service 1014 and to the transaction authority 700 indicating that the transaction is canceled. If the customer 95 says yes, please continue with the transaction, the customer is  
20     prompted to pick a payment method from among the list provided. In this example, the list corresponds to payment methods supported by both the merchandise provider and by the financial clearinghouse 200. The customer 95 fills in credit or charge card number, for example, expiration date, and billing address.

25           Upon completion of the required information, the customer's appliance 100 can send the information, using his or

her secure PPE, in a secure VDE container 152(5) to the financial clearinghouse 200, and may send a separate VDE container (not shown) with an audit record to the transaction authority 700.

5 The financial clearinghouse 200 gets pre-authorization from the credit card processing company, and, for example, using a secure VDE container 152(6) returns the pre-authorization approval information 1026 to the fulfillment server 1014. Financial clearinghouse 200 may send another VDE container 152(7) to the transaction authority 700 with an audit record  
10 302(2) indicating completion of the pre-authorization step.

The fulfillment server 1014 may send a further VDE secure container 152(8) to the customer 95 with a new Web page 1022D and audit record information 302(3) indicating that:

- the order process is complete,
- 15 • the sale has been approved by payment method,
- when the goods are shipped, the customer's credit card will be charged the total amount, and
- a transaction confirmation number for further  
reference in order to be able to make inquiries with  
20 the fulfillment service 1014 and/or with the  
transaction authority 700

The fulfillment service 1014 (e.g., in cooperation with warehouse 1018) packages the goods, hands them off to an express delivery service 1020, and, for example, sends VDE  
25 secure containers 152(9), 152(10) with audit records 302(4), 302(5) indicating shipment to the financial clearinghouse 200 and

the transaction authority 700, respectively. In this example, the express delivery service ("logistics") 1020 also sends a VDE secure container 152(11) to the transaction authority 700 and to the fulfillment service (and also, if desired, to the customer 95) indicating that the express service 1020 has taken possession of the package.

Upon delivery of the package with the merchandise, in this example, the express delivery service 1020 sends a VDE secure container 152(12) containing an audit record 302(7) indicating that delivery of the package has been completed to the transaction authority 700 which then marks the transaction completed and then may send additional VDE secure containers 152 indicating completion to the financial clearinghouse 200, to the express delivery service 1020, to the fulfillment service 1014, and in some examples to the customer 95.

**Example: Distributed Commerce Utility 75 Can Support Transactions In Which Customers Pay For Services**

A hallmark of advanced Western economies, especially the economy of the United States at the end of the present century, has been the transition from a largely manufacturing, "smoke stack" economy to not only an "information economy" but to a "service economy" as well. Distributed Commerce Utility 75 can support transactions in which customers pay for, and in many examples, consume or otherwise make use of services.

Figure 63 shows an example online service system 1030. In one example, an online service 1032 registers with the secure directory service 600 and obtains a digital certificate 504(1) from

a certifying authority 500 attesting to identity of the online service. The online service also agrees to trust certificates 504 issued by the certifying authority 500 and by parties certified by the certifying authority 500 to issue certificates for specified facts.

5

For example, the online service 1032 agrees to accept certificates 504(3) issued by a distributed certifying authority 500A from parents certified by the certifying authority 500 (through certificate 504(2)) to issue certificates attesting to the facts that they have children and that these children are currently minor children. In turn, the online service 1032 will not allow children so certified to access certain subject matter materials distributed by the online service nor to accept digital signatures based on those certificates for purchase transactions, unless the adult person responsible for the child has issued another certificate attesting to their willingness to be financially responsible (e.g., unconditionally or for purchases up to some specified limit per transaction or some aggregate level of spending in a specified time period, in one example, so much per month). These certificates 504(2), 504(3) may be sent from the certifying authority 500 to the parent and/or to at least one child in a VDE secure container 152.

Now suppose the child 95(2) subscribes to an online game called "chat." Online service 1032 has a Web interface specifically designed for school aged children. This service 1032 offers a subscription that must be renewed quarterly. Using an electronic appliance 100 such as a personal computer or TV and settop box with bi-directional communications and a protected

processing environment 154, the child 95(2) uses secure directory services 600 to locate the online service 1032, and sends a message requesting a subscription. In response, the online service 1032 sends to the parent 95(1) or guardian in a VDE secure container 152(4), a request 1034 for payment, membership, and member information. The parent or guardian and/or other paying individual 95(1) provides his or her (or their) credit card number(s), expiration date(s), and billing address information 1036 in one or more other secure containers 152(5) to the online service 1032.

In this example, the online service 1032 communicates the customer's service account, credit card and/or other payment information 1036 to the financial clearinghouse using a VDE secure container 152(6) (in a variation on this example, the parent 95(1) may have provided this financial and related information directly to the financial clearinghouse 200 in a VDE secure container 152(5)). The online service provider 1032 also provides to the financial clearinghouse 200 the clearinghouse network address and provider account number. Within a protected processing environment (which may, for example, comprise a general purpose computer locked in a physically secure vault or other secure installation), the financial clearinghouse 200 opens the secure container 152(6), extracts the payment information 1036, and completes the payment transaction with the credit card company.

For this example, the financial clearinghouse 200, in turn, communicates the following information 1038 (this list is for

illustrative purposes only and does not detract from the general case in which any available set of information might have been communicated) to the online service 1032 in at least one secure VDE container 152(7):

- 5
- VDE audit record for this transaction,
  - transaction authorization number,
  - provider account number,
  - account number of the customer at the service, and
  - amount of the payment.

10 In turn, the online service 1032 sends a secure container 152(8) to the customer 95(1) indicating that payment has been accepted. In one example, online service 1032 may instruct certifying authority 500 to issue a certificate 504 attesting to the validity of the subscription until a specified date. Online service  
15 1032 may also provide audit records 302(1) derived from the information 1038 provided by the financial clearinghouse 200.

Each time the child 95(2) logs on to the online information service 1032, the child's PPE 154 checks to determine if any certificates 504 are present or known and if so, whether:

- 20
- these digital certificates attest to an current, unexpired subscription to the online service, and
  - any minor child certificates are present and valid (for example, have not expired because the child has not yet reached their 18<sup>th</sup> birthday).

Having ascertained through these certificates 504 that the child 95(2) is authorized to use the online service 1032 and is prohibited from accessing certain “adult” content, the online service grants selective access, that is to authorized portions.

5           Among the features of this online service are distributed, multiperson interactive games. The child 95(2) in this example plays the game with at least one other authorized and certified minor child—adults are precluded by underlying VDE rules and controls from playing this game in this particular example. At  
10       least one portion of the software (e.g., executable code and/or interpretable code, such as Java) that implements at least one portion 1040 of the at least one game can be download from the online service 1032 to the child’s information appliance 100(2) using at least one VDE secure container 152(9).

15           Using methods described in the Ginter et al. disclosure, these programs and/or portions of programs 1040 are determined to be authentic and unmodified. At least one of the keys used to calculate the one way hash function that produces the digital signature used for determining the integrity of the at least one  
20       program 1040 or at least one part of a program is bound to the identity of the online service 1032 by a certificate 504 issued by certifying authority 500.

As the child 95(2) in this example plays the game, at least a portion of his or her activities are metered according to methods  
25       disclosed in the co-pending Ginter et al. application and audit records 302(2) are created that indicate this child’s usage. At certain times, these audit records 302(2) are transmitted to the

online service 1032 which may, in this example, include a usage clearinghouse 300. Usage clearinghouse 300 analyzes these usage records 302(2), and may use them to determine how much to charge child 95(2).

5    **Example: Distributed Commerce Utility 75 Can Be Used to Provide Value Chain Disaggregation for Purchase and/or Use of Tangible Items**

Distributed Commerce Utility 75 can be used to facilitate a purchase or other type of transaction relating to tangible goods.

- 10   Figure 64 shows an example tangible goods delivery system 1040. For example, a company 1042 places an order for office supplies using an electronic appliance 100 including a PPE 154. The order is for a box of paper clips, a stapler, staples, a case of 8.5 x 11 inch copy paper, and a dozen yellow legal size note pads. The items are
- 15   manufactured by a manufacturer 1050, distributed by a distributor 1048, and sold to the company by a retailer 1046.

- In this example, a financial clearinghouse 200 receives a payment 1052 from the company 1042, and disaggregates the payment by dividing it up into disaggregated payments 1052A,
- 20   1052B, 1052C which it delivers to each of retailer 1046, distributor 1048 and manufacturer 1050.

- For example, the company 1042 sends its order 1044 within a VDE electronic container 152(1) to a retailer 1046. In this example, retailer 1046 provides a fulfillment service that receives
- 25   the order 1044 and, in response, provides a control set 188 indicating the provider account number of the distributor 1048 and/or manufacturer 1050 of each item and the percent of the retail

price to be received by each. If desired, retailer 1046 may provide a different control set 188 for each item ordered (regardless of quantity) – allowing different payment disaggregation to be performed on an item-by-item basis. Retailer 1046 may provide  
5 this control set 188a to company 1042.

Control set 188a may be conditioned on the presence of one or more digital certificates 504 issued by certifying authority 500.

For example, control set 188a may require company 1042 to provide a digital certificate 504(1) issued by the certifying  
10 authority 500. Certificate 504(1) attests to the identity of the ordering company 1042. The company 504(1) may provide another certificate 504(2) in the same chain of trust hierarchy as the certifying authority 500 warranting that the person placing the order is authorized to place orders up to a specified spending limit  
15 per order. Company 1042 may provide the same or different certificate 504(2) also indicating that the purchaser employee within the company is authorized to make use of a corporate charge card.

In this example, the company 1042 pays with a corporate  
20 charge card. The financial clearinghouse 200 first gets payment authorization from the credit card company prior to the retailer 1046 shipping the merchandise. Upon receiving notification of preauthorization, retailer 1046 may ship the goods 1047 to the company 1042. Following delivery of the merchandise 1047, the  
25 retailer 1046 creates at least one VDE audit and/or billing record 1052 in at least one VDE secure container 152(2), and transmits

the container to the financial clearinghouse 200 (audit information may also or alternatively be sent to retailer 1046).

The financial clearinghouse 200 then completes the charge card transaction by allocating the total payment amount to each of the value chain participants represented by control set 188a (which it may have received, for example, directly from retailer 1046 and/or through company 1042). In this way, the distributors 1048 and/or manufacturers 1050 receive their payments at the same time the retail seller 1046 receives its payment. Control set information 188a may also indicate shares of the total payment and provider account numbers for local, state, and federal taxes, if any, and, for example, for delivery charges, such as to an overnight express company, if any.

This Figure 64 example shows that value chain disaggregation can apply for both tangibles and for intangibles. Similar techniques can also be used much further back through the manufacturer's 1050 supply chains if so desired (e.g., to the providers of the metal from which the paper clips were fabricated).

**Example -- Distributed Commerce Utility 75 Can Help Distribute Digital Properties By Providing Object Registry And Other Services**

Distributed Commerce Utility 75 can assist the electronic community in efficiently distributing electronic or digital properties or content. For example, using an electronic appliance 100 equipped with a protected processing unit 154, a creator or other rights holder 400 sends a digital object in a secure container to a rights and permissions clearinghouse 400 to be registered.

The rights and permissions clearinghouse 400 opens the container using, for example, its own VDE protecting processing unit, and assigns a uniform object identifier indicating the identity of the creator, the type of object being registered - software, video,  
5 sound, text, multimedia, etc., and the digital signature for the object. The uniform object identifier may be globally unique or may be unique only in the namespace domain of the creator or some other entity, such as an online service, digital library, or specific jurisdiction, such as a specific country.

10 In this example, using its protected processing environment, the rights and permissions clearinghouse 400 digitally signs the uniform object identifier with the rights and permissions clearinghouse private key and returns the object and identifier to the person or organization registering it in a VDE secure  
15 container. The rights and permissions clearinghouse 400 may retain a copy of the object or may retain only the uniform object identifier for the object, and the signatures for the object and its uniform object identifier. In another example, the rights and permissions clearinghouse 400 digitally signs a new object  
20 comprised of the original object and its uniform file identifier, and stores both the new object and/or its signature in the rights and permissions clearinghouse 400 archive.

The creator may have also sent in a VDE secure container a permissions and pricing template 450 (see Figures 45A-45C)  
25 indicating which permissions are granted, the prices to be charged upon exercising those permissions, and if applicable, the individual, class and/or jurisdiction to which those prices and

permissions apply. More than one permission and pricing template 450 may be sent in a single VDE secure container 152, or separate VDE secure containers 152 may be used for each permission and pricing template.

5           In this example, using a VDE secure container 152, the object is then transmitted from the creator to a distributor 168 (see Figure 16). Using a certificate 504, the distributor 168 can prove to the VDE instance (PPE 154) interpreting the creator's control set that the distributor is indeed authorized to selectively alter  
10   permissions and prices of the object and creates a new permissions and pricing template. The distributor 168 then sends a VDE secure container to the rights and permissions clearinghouse 400 containing the uniform object identifier together with the new controls. In the preferred embodiment, if the object remains  
15   unmodified, the distributor 168 has the option of leaving the uniform object identifier unmodified; however, if the distributor has modified the object, perhaps to add its own brand, then the uniform object identifier must be modified to reflect the distributor's version. The digital signature is recomputed using the  
20   private key of the distributor. As before, the object registry has the option of storing only the digital signature or both the signature and the actual object.

**Example – Distributed Commerce Utility 75 Can Be Used to Facilitate Copyright Registration**

25           As a value added service, the rights and permissions clearinghouse 400 can provide a copyright registration service (see Figure 43). The rights and permissions clearinghouse 400 can send

a copy of the object to the appropriate online copyright registration service of the appropriate government agency 440, for example, the US Copyright Office. The object and uniform object identifier may be sent in a VDE secure container together with  
5 controls indicating the mode of payment, if a registration or processing is being charged.

In this example, the copyright registration service can send at least one VDE secure container to the financial clearinghouse 200 with at least one audit record indicating the amount to be paid,  
10 the payment method and account of the registering party, and the account of the government to receive the funds, and receives in return in a VDE secure container an audit record indicting that the transaction has been pre-authorized (or that for whatever reason, the proposed transaction has not been authorized).

15 If the transaction has been pre-authorized by the financial clearinghouse 200, a VDE enabled computer located, in this one example, in US Copyright office opens the secure container and adds the uniform object identifier and the object to the registration database. Under a chain of trust emanating from the certifying  
20 authority 500—which in this example may be operated by, or on behalf of the US government—the copyright registration service issues at least one digital certificate 504 attesting to the facts that an object with a specified uniform object identifier and with a specified digital signature has been in fact registered with the  
25 registration authority and that the at least one person is in fact the owner of the copyright at the time the object was registered. This certificate 504 is sent in a VDE secure container to the person who

registered the object (and/or who was named as the person to be notified) and to the rights and permissions clearinghouse 400 who, in turn, may provide copyright registration information upon request in a secure VDE container.

- 5           The copyright registration service sends at least one VDE secure container to the financial clearinghouse 200 with at least one audit record instructing the clearinghouse 200 to proceed with fulfillment of the pre-authorized transaction (if all necessary information was part of the pre-authorization process) and/or
- 10       providing information to the clearinghouse 200 regarding, for example, the amount to be paid, the payment method and account of the registering party, the account of the US government to receive the funds, and that the payment transaction should be completed, and receives in return from the financial clearinghouse
- 15       in a VDE secure container an audit record indicting that the transaction has been completed and funds deposited in the appropriate account or accounts, or that the payment transaction fail and the reason why it failed to be completed.

20       **Example – Distributed Commerce Utility 75 Can Support  
Renewal Or Modification Of Permissions And Prices**

Distributed Commerce Utility 75 can further facilitate the distribution of electronic and digital properties by providing a mechanism for renewing rights and permissions that have expired. See Figure 42A.

- 25           In one example, suppose an employee of a Fortune 1000 company has a control set for a digital property, perhaps a piece of software or a Java applet, that has expired. The VDE protected

processing environment on the employee's computer can send a VDE secure container to the rights and permissions clearinghouse 400.

5 Distributed Commerce Utility 75 can also facilitate the distribution of electronic and digital properties by providing a mechanism for distributing rights, permissions and prices that have been changed by one or more participants in a distribution chain. In one example, suppose a customer has a digital object on her hard disk and its VDE control set as distributed by the publisher. The permissions and prices originally indicated a pay  
10 per use model in which the user pays 10 cents for each operation on the object, such as printing or viewing.

To determine if new rights and prices are now available, the protected processing environment on the customer's PC can send a  
15 VDE secure container to the Rights and Permissions clearinghouse 400 using its network address obtained from the control set together with MIME-compliant electronic mail. The customer obtained the address of the rights and permissions clearinghouse from the secure directory service 600, having, for example, sent a  
20 query in a VDE secure container and having received a response in a VDE secure container.

The VDE secure container sent to the rights and permissions clearinghouse 400 contains the object identifier plus a request for the current controls including prices. The protected processing  
25 environment at the rights and permission clearinghouse 400 server opens the VDE secure container, retrieves the most recent control set from the database of controls, and sends via return electronic

mail another VDE secure container with the desired controls. The customer's protected processing environment opens this container, and replaces and/or augments the expired controls with the new ones. The customer is now able to use the content according to the  
5 rules and controls specified in the control set just received from the rights and permissions clearinghouse and processed by the instance of VDE on the local computer or other appliance. In this example, these new rules and controls have reduced the pay per use price from ten cents per operation to five cents per operation.

10 **Example – Distributed Commerce Utility 75 Can Support Models To Distribute New Rights**

Distributed Commerce Utility 75 can also support transactions in which some or all rights are not initially distributed to the ultimate consumer with the content, but must be requested  
15 instead. In one example, suppose a lawyer decides to go into the publishing business by combining her/his own articles with other materials obtained from legal information distributors. The legal information distributors have chosen a rights and permissions clearinghouse 400 to be their distributor of control set information  
20 for their many properties. With each object they register at the rights and permissions clearinghouse 400 they also register two control sets in the formats described in the Ginter et al. disclosure:

- one control set specifies default controls including prices for retail customer, and

- a second control set conveys rights and prices seldom of interest to the retail customer, for example, the anthologizing right.

The attorney newsletter publisher obtains a chapter from a  
5 treatise on patent law and wants to include a 1000 word excerpt in  
the newsletter in addition to other articles. Having already  
obtained the treatise chapter and its retail control set, the  
newsletter publisher sends an inquiry in a VDE secure container  
using Internet MIME-compliant e-mail to the rights and  
10 permissions clearinghouse 400 asking for the excerpting right and  
the anthologizing right for the chapter identified by the enclosed  
uniform object identifier. The lawyer found the rights and  
permissions clearinghouse 400 using a secure directory service  
600 (alternatively the rights and permissions clearinghouse 400  
15 address may be contained in the original retail version received by  
the lawyer).

The rights clearinghouse 400 checks the object database,  
locates the control set information for the object named in the  
universal object identifier, and determines that both the excerpting  
20 and anthologizing rights are available along with the prices for  
each. The excerpting right does not convey the right to modify the  
excerpted portion. The anthologizing right is conveyed along with  
controls that set the price to a 30% discount from retail prorated  
for the length of an excerpt if the whole chapter is not  
25 anthologized.

Using a VDE aware page composition application, the  
newsletter publisher combines several works, including the 1000

word excerpt into a new work, and registers the new object with the rights and permissions clearinghouse together with its control set(s). The newsletter publisher also registers the new object with a copyright registration function, for example, the US Patent and Copyright Office. The newsletter publisher distributes the new work in a VDE secure container, which also contains control sets for each of the separate anthologized works, and for the whole, complete newsletter as well. The local VDE protected processing environment on the appliance of the user keeps track of usage according to the controls that apply to the composite object and to the controls of each of its parts for which there are separate rules. At some time, the VDE instance sends audit records to the usage clearinghouse 300 and to the financial clearinghouse 200.

**Example – Distributed Commerce Utility 75 Can Support Electronic Rights Negotiations**

Distributed Commerce Utility 75 can support electronic rights negotiations. In one example, suppose a professor is creating a "course pack": a compilation of many different works to be used by students in a particular course that in this example, lasts only one semester. In this example, the professor sends a VDE secure container with a query to the appropriate rights and permissions clearinghouse 400 and gets back control sets for the digital properties listed in the query. Upon reviewing the permissions and prices, the professor notes that a chapter from a book carries a price large enough to make the overall price of the course pack higher than the maximum s/he desires.

Using the negotiation mechanisms disclosed in Ginter et al. (see, for example, Figures 75A-76B), the professor attempts a negotiation with the rights and permission clearinghouse 400. The rights and permissions clearinghouse 400, in turn, automatically  
5 determines it lacks the authority to negotiate and redirects the negotiation to the publisher.

Having obtained an appropriate certificate 504 from a certificate authority 500 by providing credentials indicating membership in the class "higher education", the protected  
10 processing environment of the publisher's Web server makes an offer of a new, modified control set for the property targeted for this professor. The controls have a discounted price, require that the copies be printed on a VDE enabled authorized printer that will keep track of the number of copies printed, and report back to  
15 the various parties to the transaction using VDE techniques. Still unhappy with the price, the professor sends a VDE negotiation counter-offer in a secure container to the publisher. The publisher's VDE instance negotiates with the professor's negotiation counter-offer control set and an agreement is reached  
20 that and provides a new control set with the new, agreed-upon prices and terms and conditions to the professor, who then goes ahead to produce the course pack. The rights and permissions clearinghouse 400 is willing to grant the reduced price in part because the professor in this example is able to provide a digital  
25 certificate attesting to the fact that she has a full-time appointment at the University of California, Los Angeles and has a certain, minimum number of students who will employ the materials. This

authentication meets requirements stated by the publisher to the rights and permissions clearinghouse 400.

**Example – Certification of Executables**

5        One valuable use of certifying authorities 500 is for the issuance of digital certificates on behalf of the government. In addition to issuing certificates attesting to identity, legal status, etc., government certifying authorities 500 might issue certificates certifying executables, for example load modules. For example,  
10       government certifying authorities 500 at all levels might certify the set of executables that represents the laws and trade practices of their administrative districts. For example, Saudi Arabia might insist that all appliances in their administrative control have load modules certified by the government that examine attributes of  
15       containers to insure that only appropriate content is released. The State of California might certify a load module that calculates state tax, etc.

**Example – Entertainment Distribution**

20       Distributed Commerce Utility 75 can be used to efficiently and flexibly support models for film distribution to the consumer market. For example, suppose that a film and entertainment company such as Disney wants to provide electronic Distributed Commerce Utility 75 to support distribution of its films to  
25       consumers 95. Disney could open a Commerce Utility System 90 itself, or it might contract with a neutral third party to provide Commerce Utility Systems 90 on its behalf. The purpose of the

Commerce Utility Systems 90 in this example is to support secure pay-per-view/pay-per-use, rental, lease and other film distribution transactions to consumers.

The films themselves could be distributed in digitized linear form — for example, on Digital Versatile Disk (DVDs) or other high capacity media. Such media would store, in addition to the films themselves, one or more secure containers including control sets for controlling use of the films. Consumers 95 could play the films using a media player 104 (see Figure 1) having a network  
10 150 connection or other “back channel” (e.g., the ability to read from and write to a smart card or the like).

Media player 104 has a protected processing environment 154 such as a secure processing unit for use in managing rights and manipulating the electronic containers. The storage media  
15 might also be played by a personal computer 124 equipped with a protected processing environment and a network connection.

Set top box 104 may be controlled by electronic controls distributed on the media and/or via the back channel. The controls require the set top box 104 to record customer usage and payment  
20 information for each property the consumer decides to view. For example, a consumer 95 might place a media such as an optical DVD disk into media player 104 and hit the “play” button. The consumer’s media player 104 might next display (e.g., on television set 102) a message telling the consumer how much it  
25 will cost to view that particular film (e.g., \$2.95), and ask the consumer if she wants to proceed. If the consumer answers “yes”, media player 104 will play the film on the consumer’s television

set 102 — recording usage and payment information for reporting to Commerce Utility Systems 90. The protected processing environment 154 within media player 104 may, under secure control of one or more associated electronic control sets delivered to it -- monitor and collect information that can ultimately be used to ensure the consumer pays for watching the film and to provide a secure usage audit . The secure usage audit may be used, for example, to allow Disney, the film's actors and director, and others involved in making the film to securely verify how many consumers watched the film (and also potentially to provide demographic information for targeting advertising or the like). For example, the media player 104's protected processing environment may securely collect and record, for example, the following information within meter, billing and/or budget audit trails associated with particular controls:

- name of film
- digital identifier of film
- time and date property played
- number of times property played
- who played the property.

In one example, consumers 95 would have to possess a digital certificate 122 issued by an appropriate certifying authority that attests to certain facts. Such a digital certificate 122 can be used to provide a context for the electronic control set(s) delivered to media player 104. Such a certificate might need to be present before the consumer would be permitted to play the film and/or to

prevent the film from playing under certain conditions and/or to effect the controls that apply when the film is played.

For example, the parents could obtain a digital certificate 122 indicating that the household has children. This “child present” digital certificate 122 could be used to prevent media player 104 from playing any films other than those that have “G”, “PG” ratings. Such certificates 122 could be issued by the same organization that provides the other administrative and support services in connection with this example if desired.

10       The electronic controls provided with a particular film on a media such as an optical disk may also specify a particular value chain disaggregation to be applied in connection with payment arrangements. For example, the media player 104 would “know” from the electronic rules and controls delivered to it that the film distributor, studio and the Distributed Commerce Utility 75 are to receive particular percentages of the \$2.95 usage fee, and that a state government authority must receive a certain tax payment in the form of a sales tax or VAT. Because this information is maintained within the protected processing environment 154 within media player 104, the consumers 95 may never be exposed to the payment disaggregation scheme and/or its details. (Typically, consumers do not care what the distributor “cut” is as opposed to the studio revenue. The protected processing environment within media player 104 may provide this payment 25 disaggregation locally or through a distributed or centralized financial clearing function 200 as described above.)

Media player 104 can report the usage containment information it has collected on a real time (online) and/or periodic event-driven basis. In one example, media player may report at the end of each month the information it has collected over the preceding month. It may report collected payment information (including disaggregation data provided by the control set) to a financial clearinghouse 200 run by Disney (or, for example, such information may be reported directly to clearinghouse 200). Financial clearinghouse 200 ensures that the consumer's account is appropriately debited and that the various payees (e.g., Disney, the film's distributor, and others in the value chain) receive appropriate "splits" of the consumer's payment. The financial clearinghouse 200 may also provide consumer credit checks and authorizations, helping to ensure that the consumer doesn't run up a big bill she can't pay.

Media player 104 may report the usage information it has collected to a usage clearinghouse 300 operated by an independent auditor (the film's producer and actors may insist that an independent third party auditor – not Disney – performs this function) or, for example, may report such information to Disney and/or clearinghouse 200 -- certain of such information may be concealed from Disney if required by rules and controls to ensure other value chain party rights and Disney may not be able to identify, alter, and/or remove such information due, for example, to VDE protection mechanisms. The usage clearinghouse 300 may analyze the usage data and issue reports indicating total number of views, market share, etc. Usage clearinghouse 300 may

also further analyze the information to provide demographic and/or other marketing research information. This type of information can be very useful to advertisers and marketers.

Disney may also operate a rights and permissions clearinghouse 400. Even though permissions are distributed on the optical media in this example, the rights and permissions clearinghouse can provide supplemental control sets for various reasons. For example, the control sets distributed on the media may expire on a certain date. Rights and permissions clearinghouse 400 may issue new control sets in lieu of the expired ones. Rights and permissions clearinghouse 400 may also issue permissions to provide "sales" and/or to otherwise change prices (e.g., to reduce the price of an older film). Rights and permissions clearinghouse 400 can also issue special permissions (e.g., an extracting or anthologizing right that multi-media developers or advertisers might be able to request, and/or, for example, redistribution rights to certain frames such as an approved image of Mickey Mouse for printing purposes). Disney could "pre-approve" some of these special permissions so that the rights and permissions clearinghouse could automatically provide them on demand. Digital certificates 122 might be used to interact with the permissions – thereby assuring that the user receiving the control set is entitled to take advantage of it.

**Example: Distributed Commerce Utility 75 Can Support The Collection, Analysis, and Repurposing Of Usage Information**

Prior to the inventions disclosed in the Ginter et al. specification, the electronic community lacked general purpose, reusable, distributed, peer-to-peer technologies that could, among  
5 other things, efficiently and effectively monitor and measure usage on the local computer or protected processing environment. Collecting, analyzing, and reporting usage data provides significant value to rightsholders and to other distribution chain participants, to infrastructure Distributed Commerce Utility 75, to  
10 customers, and to other interested parties. Understanding what has happened can often be a fundamental determinant or contributor to what might or should happen. In addition, usage information can be repurposed to support a wide range of other commercial activities, including advertising and merchandising models.

15 Suppose one or more customers in each of several companies have information appliances 100, in this one example such as personal computers, with VDE protected processing environments (PPEs) 154 as described in Ginter et al. Suppose further that over some time period, perhaps a month in this  
20 example, that VDE has been keeping track of detailed usage information and storing this information in the encrypted database on each hard drive on each computer that is a logical extension and under the control of each consumer PPE. These consumers have each been purchasing different combinations of information  
25 and entertainment from generally different sources. Each instance of VDE keeps track of usage information according to the controls

associated with the content and/or service being purchased or otherwise used.

On or shortly after the first of each month, and/or any other required (or, if supported, allowed) reporting intervals, each  
5 instance of VDE communicates the usage records to the usage clearinghouse 300 according to the controls associated with each of the digital properties they have used during the previous month. In turn, the usage clearinghouse 300 provides reports to each of the rightsholders regarding any use of a property during the  
10 previous month or other reporting interval (e.g., daily, weekly, quarterly, annually, etc.).

In one example these reports contain information identifying both the individual customer and the company that employees them. In another example, the reports contain detailed  
15 usage information, but the identities of the individual customers has been removed by the usage clearinghouse 300. Alternatively, both the individual and corporate identities may be removed. Instead, the usage information may be aggregated by any one or more certain classes, such as by industry, geography, and/or by  
20 country, and/or any other useful classes.

In another useful example, a particular company or individual customer may have not permitted VDE (subject, of course, to this right being available through in place rules and controls) to communicate identity information to the usage  
25 clearinghouse 300 from their information appliances in the first place. The user may have established VDE controls prohibiting disclosure of such identifying information. In another example, the

user may have used the negotiation mechanisms disclosed in the Ginter et al. application to negotiate additional levels of privacy and confidentiality other than those required in the various control sets associated with the information being purchased or otherwise  
5 used by each customer, that is, the electronic negotiation process generates a modified or new rules and controls set reflecting the additional levels of privacy and confidentiality. In yet another example, a rightsholder, rights and permissions clearinghouse 400 or usage clearinghouse 300 or other party, may have used the  
10 same negotiation mechanisms to negotiate, through the use of VDE rules and controls sets alternative levels of privacy and confidentiality.

As illustrated in Figures 11 and 33-39, the usage clearinghouse functions that may remove identifying information,  
15 aggregate data, analyze data, generate reports, and/or transmit those reports to rightsholders and other interested parties may exist in one or more logical and physical locations. For example, a distributed usage clearinghouse 300 executing on the local computer (or other information appliance) may perform any or all  
20 of these usage clearinghouse functions. One or more usage clearinghouses may exist within a given company or within a given collection of companies comprising a vertical industry, healthcare, for example, trading group, or family of companies ("keiretsu"). Similarly these usage clearinghouse functions may be  
25 performed by usage clearinghouses within each country or other jurisdiction or defined by any other class and/or geographic variable.

Usage clearinghouse 300 may also provide raw data, aggregated data, and/or customized reports to rightsholders, distribution chain participants, and/or other interested parties. These parties include: for example, content creators, publishers, repackagers, repurposers, advertising agencies and their clients, trade associations, market research and consulting companies, circulation audit and audience measurement bureaus, the sales, marketing, and advertising functions of companies with an interest in one or more markets, and government agencies.

10 In another example the usage clearinghouse 300 may also sell information to advertisers indicating exposure to particular ads and/or classes of ads by individuals, customers within a company and/or group of companies, markets, and/or other analysis groupings and categories.

15 **Example: Secure Directory Services Protect Confidentiality and Privacy**

Personal and business confidentiality and privacy are often essential aspects of the modern experience. Individuals may not want others to know with whom they are associating. In many aspects of business, firms may not wish to reveal their interest in communicating or interacting or conducting business with other parties. In today's Internet, for example, it is possible for those with certain kinds of access to determine the nature of queries between a given person and a directory service. Such information may provide important clues regarding existing or pending business arrangements that have not yet been publicly announced, a merger or acquisition, for instance.

VDE secure containers provide one basis for secure directory services 600 in which confidentiality and privacy are preserved. In one example, the Corporation Counsel in a Fortune 100 company wishes to obtain the email address of the investment  
5 banker in the firm handling a proposed acquisition -- but without revealing her interest to anyone else. The attorney sends a query in a VDE secure container to the secure directory service 600 with the name and company of the person she wishes to contact. The secure directory service then sends the response in another VDE  
10 secure container back to the attorney. Both the query and the response can make use of certificates issued by the certifying authority 500 authenticating both the attorney and the secure directory service 600. Payment for the query can be handled by the financial clearinghouse 200 who deposits payment in the  
15 provider account of the secure directory service 600 while debiting the account of the company that employs the attorney.

Because these transactions are conducted using VDE and VDE secure containers, those observing the communications learn no more than the fact that these parties are communicating.  
20 Security analysts have developed techniques for "traffic analysis", in which the frequency of communications among two or more parties is observed and changes in the frequency of communications are correlated with other information to make inferences regarding the content and/or purpose of these  
25 communications.

Using VDE and VDE secure containers, it is possible to defeat traffic analysis, however at some added expense. In this one

example, the company could send a VDE container to the secure directory service 600 with an empty or "null" query that would generate in the average amount of elapsed time a return message in a VDE container with a null response. The instance of VDE on the attorney's computer would generate a payment transaction destined for the financial clearinghouse, but would aggregate these payment records with others to eliminate correlations between the pattern of queries and payments. While inefficient from a commerce standpoint, this method of using VDE and VDE secure containers to defeat traffic analysis attacks can in principle be used among plural parties wishing to hide the pattern of communications among them while taking advantages of the secure, trusted, efficient distributed transaction capabilities disclosed in the Ginter et al. application.

**Example: Cooperation Among Clearinghouses Internal and External To An Organization**

The various Commerce Utility Systems 90 may be distributed to varying degrees and in varying combinations as illustrated in Figures 2A-2E and 3A-3C). In one example shown in Figure 65, an American Fortune 100 company with operations in several countries (e.g., the United States, Japan and Europe) and within many of those, in multiple locations within each country, has found it desirable to internationally distribute VDE Distributed Commerce Utility 75. To increase the efficiency of purchasing external information, and to maximize its leverage with information providers, the company 1070 has chosen to negotiate with several providers, agreements that treat all

purchases as having been made from within the US and being in US dollar currency. In this example, the company 1070 maintains its own global Intranet 1072. Intranet 1072 connects company headquarters 1074HQ (shown here as being located within the United States) with company US employee electronic appliances 1074US(1), ..., 1074US(N), company Japanese employee electronic appliances 1074JP(1), ..., 1074JP(N), and company European employee electronic appliances 1074EU(1), ..., 1074EU(N). Intranet 1072 also permits each of these employees 1074 to communicate with one another. VDE-based transactions between the company 1070 and its information suppliers are also routed through one or another of the company's US gateways to the Internet.

To provide efficient administrative and support services, the company 1070 has deployed in each country at least one distributed financial clearinghouse 200 and at least one distributed usage clearinghouse 300. For example, company 1070 may operate a financial clearinghouse 200A and a usage clearinghouse 300A in the United States, a financial clearinghouse 200B and a usage clearinghouse 300B in Japan, and a financial clearinghouse 200C and usage clearinghouse 300C in western Europe. In countries with multiple sites and within the United States, several of these distributed clearinghouses may exist. In addition to negotiating agreements with information providers, the company 1070 may also have negotiated agreements with a large commercial usage clearinghouse 300 and with a major financial clearinghouse 200. These centralized clearinghouses could be

located anywhere, and may communicate with company 1070 via the Internet and the corporate Intranet 1072. Neither of these clearinghouses 200, 300 are affiliated with the company 1070 other than through this business arrangement. Each of the  
5 distributed clearinghouses within the company 1070 operates under the simultaneous authority of both the company and the external clearinghouses with which the company has a business arrangement.

In this one example, a product marketing manager  
10 1074JP(1) employed by this company 1070 in Japan acquires a market research report 166 from an American distributor 1076. The report and associated controls are sent from the American distributor 1076 to this employee 1074JP(1) in a VDE secure container 152a. The instance of VDE on the manager's appliance  
15 1074JP(1) keeps track of usage and the payment due the information provider. Periodically, these audit records 302(1), 302(2) are transmitted in VDE secure containers 1052b, 1052c to distributed usage clearinghouse (private usage clearinghouse) 300B and to the internal financial clearinghouse 200B -- both of  
20 which are located in Japan on the company's internal, private corporate network (or Intranet) 1072. From time to time and in accordance with VDE controls associated with the content purchased, the private usage clearinghouse 300B removes, in this example, individual identifying information in accordance with  
25 VDE rules and controls managing protected processing environment processes and sends in a VDE secure container the audit records 302(3) to the external, commercial usage

clearinghouse 300. All of the company's internal, distributed usage clearinghouses 300A, 300B, 300C send periodic communications in VDE secure containers 152 to the commercial usage clearinghouse 300. In turn, the master usage clearinghouse  
5 300 creates and sells, licenses, and/or otherwise distributes reports to rightsholders and other parties (e.g., third parties having a commercial interest in obtaining the information) in which the identities of individuals are removed, and which in many circumstances company names, in accordance with VDE rules and  
10 control, have also been removed.

From time to time and in accordance with VDE controls 188a associated with the content 166 purchased, copies of the complete usage records (with employee identification information) are also sent to the company's master usage clearinghouse 300HQ  
15 (which may be located at corporate headquarters), as are audit records from all the company's distributed usage clearinghouses 300A, 300B, 300C. These are then aggregated and combined for further analysis, reporting, and auditing.

The internal, distributed financial clearinghouses 200A,  
20 200B, 200C also receive audit records 302 in VDE secure containers 152 in accordance with VDE controls sets for the purchased information from each of the VDE protected processing environments 1074 reporting to them. Each internal financial clearinghouse 200A, 200B, 200C aggregates the payments and  
25 from time to time sends a VDE secure container 152 with audit records 302 indicating the aggregate sums to be transferred to the information providers as a result of transactions. The company

may also provide update information regarding the accounts from which the company's funds are to be transferred and/or the provider accounts that are to receive such funds. In turn, the external master financial clearinghouse 200 completes these

5 payment transactions and sends audit records back to the company 1070 and to the information providers confirming the payment transactions. In the preferred embodiment, these activities occur securely under the control of distributed VDE nodes, and are automated at least in part through the use of VDE containers and

10 chain of handling and control managing multi-nodal, multi-party, sequence of processes. As an alternative example, the calculation for the amount of payment and the completion of the payment transactions is performed at the external master financial clearinghouse 200 from usage information received from the

15 usage clearinghouse 300 (of course, if usage clearinghouse 300 and financial clearinghouse 200 are the same party, the financial clearinghouse already has received such information). The external and internal financial might then, in this example, compare payment information.

20 This example does not depend on the extent to which administrative and support services are distributed. In a related example, the usage and financial clearinghouse functions could have been distributed to each VDE-aware protected processing environment 1074 as illustrated in Figures 2A-2E and 3A-3C. In

25 this example, each protected processing environment 1074 could report directly to the master external clearinghouses 200, 300, to distributed external clearinghouses, and/or to internal

clearinghouse functions organized differently than described just above, for example, by continent (North America, South and Central America, Australia, Europe, etc.) rather than by country and company 1070 location.

- 5           In one further example, the corporate headquarters 1074HQ and its associated headquarters-based clearinghouses 200HQ, 300HQ provide a centralized clearinghouse system through which all usage and financial information must flow. In this particular, more centralized example, all user appliances 1074 report their
- 10   usage and financial transactions to headquarters-based clearinghouses 200HQ, 300HQ in secure containers 152 over Intranet 1072. Company headquarters financial clearinghouse 200HQ may interface directly into VDE compliant general purpose payment systems that directly support the use of VDE
- 15   chain of handling and control for ensuring the enforcement of automated, secure, financial transaction fulfillment in accordance with rules and controls governing payment related variables such as payment amounts, parties, locations, timing and/or other conditions. These headquarters-based clearinghouses 200HQ,
- 20   300HQ, (which may function as a single, integrated Commerce Utility System) in turn, may communicate appropriate aggregated and/or other audit trail and/or payment information to the individual clearinghouses 200A, 200B, 200C, 300A, 300B, 300C within each country. While less efficient than the less hierarchical
- 25   example described above, this arrangement may appeal to large corporations who wish to exert centralized control over usage and financial information by acting as the central administrator for the

provision of credit and/or electronic currency to distributed internal financial clearinghouses and by efficiently managing in-house collection of transaction related information.

5 **Example: Transaction Authorities Can Be Used Within and Between Organizations**

Figure 66 shows an example use of transaction authority 700 for inter and intra organizational communications. Figure 66 shows an organization A (left-hand side of the drawing) as having an "Intranet" (a private data network within a particular  
10 organization) 5100(A). Intranet 5100(A) may be a local and/or wide area network for example. User electronic appliances 100(A)(1), ..., 100(A)(N) (for example, employees of organization A) may communicate with one another over Intranet 5100(A).

Figure 66 also shows another organization B that may have  
15 its own Intranet 5100(B), user electronic appliances 100(B)(1), ..., 100(B)(N), and private transaction authority 700(B). In addition, Figure 66 shows a public data network 5104 (such as the Internet for example) and a public transaction authority 700(C). Figure 66 shows that in this example, organizations A and B communicate  
20 with the outside world through trusted transaction authority 700(A), 700(B) (which may, if desired, also include "gateways", "firewalls" and other associated secure communications components). In other examples, trusted transaction authority 700(A), 700(B) need not be the actual "gateway" and "firewall"  
25 to/from Internet 5104, but could instead operate wholly internally to the respective organizations A, B while potentially generating electronic containers 302 for transmission over Internet 5104.

In this example, organization A user protected processing environments 100(A)(1), ..., 100(A)(N) each have an instance of a virtual distribution environment protected processing environment, and can communicate with one another over Intranet 5100(A) via secure electronic containers 302. Similarly, organization A user electronic appliances 100(B)(1), ..., 100(B)(N) each have an instance of a virtual distribution environment protected processing environment, and can communicate with one another over Intranet 5100(B) via secure electronic containers 302.

10 In addition, organization A and organization B can communicate with one another over Internet 5104 via secure electronic containers 302.

Organization A's private trusted transaction authority 700(A) may be used for facilitating organization A's internal communications and processes. Private trusted transaction authority 700(A) might be used, for example, to carefully track items sent from one user to another within organization A. The public transaction authority 700(C), meanwhile, can be used to coordinate between organization A and organization B without, for example, revealing confidential information of either organization to the other organization. Below are more detailed examples of how the Figure 66 arrangement might be advantageously used to conduct business transactions.

Suppose a confidential memo needs to be approved by users 100(A)(1), 100(A)(3) and 100(A)(5) (who can each revise the memo) before being distributed to each of users 100(A)(2), 100(A)(7)-100(A)(10) and 100(A)(12) (none of whom can change

- the memo), with copies to users 100(A)(1), 100(A)(3) and 100(A)(5) (who also can't change the memo after all three of them have signed off on it) and to no one else. Private transaction authority 700(A) can maintain a rule set that specifies these
- 5 requirements. Transaction authority 700(A) can:
- send the memo (in secure containers) in "round robin" fashion to each of users 100(A)(1), 100(A)(3) and 100(A)(5) for approval.
  - If any one of these users changes the memo, then
- 10 transaction authority 700(A) can circulate the revised memo to the other two for additional comments and revisions.
- Once all three of users 100(A)(1), 100(A)(3) and 100(A)(5) approve the memo, transaction authority 700(A) may be empowered to place each of their digital and/or handwritten
- 15 signatures or initials on the memo, place it into one or more secure containers with a control set specifying it is read only and can only be read by users 100(A)(1)-100(A)(3), 100(A)(5), 100(A)(7)-100(A)(10) and 100(A)(12).
- Transaction authority 700(A) may then send a copy of the
- 20 memo in a container to each of these users, or could require the same container to circulate from one to another.
- The transaction authority 700 may require the electronic controls to maintain a secure audit trail indicating where the container has been, who has opened it, who has accessed the
- 25 memo it contains, and when. Transaction authority 700(A) might thus increase personal accountability by evidencing

whether a particular person had seen a particular document, when, and for how long.

Organization A's Intranet 5104 might also be used to exchange and/or distribute highly confidential design specifications. Transaction authority 700(A) can, for example, maintain, in digital form, a detailed record of who has "signed off" on the design specifications -- thus ensuring personal accountability and providing a high degree of efficiency.

As mentioned above, private transaction authorities 700(A), 700(B) can also provide a "firewall" function to protect confidential information from escaping to outside of the respective organizations A, B. Suppose for example that organization A is an integrated circuit design house and organization B is an integrated circuit foundry. Organization A designs and specifies the circuit layout of a chip, producing a "tape out" that it sends to organization B. Organization B manufactures an integrated circuit based on the "tape out", and delivers chips to organization A.

Transaction authority 700 can be used to facilitate the above business transaction while protecting confidentiality within each of organizations A and B. For example:

- organization A's private transaction authority 700(A) can supervise an overall design and specification development effort within organization A. All communications take place in secure containers 302 over organization A's Intranet 5100(A) to maintain confidentiality. Transaction authority 700(A) can maintain a secure archive of historical

design documents, works in progress, and specification versions as the design process progresses.

- Organization A's private transaction authority 700(A) can manage the final design specification development --  
5 ensuring that all conditions required to finalize the design specifications are followed.
- Once the design specification has been finalized, transaction authority 700(A) can circulate it within secure containers  
152 to those individuals within organization A that need to  
10 "sign off" on it. Their respective appliances 100(A)(1), ...  
100(A)(k) can affix and/or embed digital signatures, handwritten signatures, seals and/or fingerprints as described above to indicate specification approval.
- Upon being satisfied that the specification has been "signed  
15 off" by the appropriate people, transaction authority 700(A) can send it over Internet 1104 within a secure container 302 to public transaction authority 700(C). Public transaction authority 700(C) may be a commercial transaction authority retained by organizations A and B to act as a liaison  
20 between them. Organization A's private transaction authority 700(A) can filter (or protect) all information it sends to public transaction authority 700(C) to ensure that organization B can access only that information intended for it. For example, private transaction authority 700(A) might  
25 provide additional electronic controls within the container to prevent organization B from seeing any detailed audit

information showing where the specification has been within organization A.

- The public transaction authority 700(C) might act as an independent trusted third party, notarizing and/or certifying the design specification to later evidence that organization A delivered it on a particular date and time in accordance with a contract.
- Public transaction authority 700(C) could then forward the design specification (still within a secure container) over Internet 5104 to organization B's private transaction authority 700(B).
- Organization B's private transaction authority 700(B) could automatically send a copy of the design specification over organization B's Intranet 5100(B) to the appropriate users 100(B)(1), 100(B),(N) within organization B. No one outside of organization B would need to know who received a copy of the specification. On the other hand, organization A's transaction authority 700(A).could, if desired, include electronic controls restricting access to only certain engineers within organization B - and these secure controls would be carried along into organization B and securely enforced by electronic appliances 100(B)(1),..., 100(B)(N). Organization B's transaction authority 700(B) could manage the chip manufacturing process, ensuring that all steps and conditions required to manufacture chips in accordance with organization A's design specification are followed.

**Example – Transaction Authority Can Facilitate International Commerce**

Figure 67 shows an example of how transaction authority 700 can be used to conduct international commerce. In this particular example, a transaction authority 700 coordinates a complex multi-national transaction between companies 1106A, 1106B and 1106C located in their own respective countries (e.g., the United States, Australia and Europe). Company 1106A has its own bank 1108A and lawyers 1110A. Similarly, company 1106B has its own bank 1108B and lawyers 1110B, and company 1106C has its own bank 1108C and lawyers 1110C.

The transaction authority 700 may assist in forming agreements between the international parties, by for example passing offers and counteroffers back and forth in secure containers and using the contract forming techniques described above to establish some or all of the terms and provide non-repudiation. Once a contract is formed, transaction authority 700 may maintain a master set of rules and controls specifying all the conditions that must be satisfied to complete the transaction -- and may thus provide consequences for different events. Alternatively, once the contract is executed, the transaction authority role may be virtual, particularly in simpler models, that is the value chain rules and controls can be carried by VDE containers whose rules and controls may, as a whole, specify all processes and conditions that must fulfilled, including their sequence of operation. Rules and controls provided by a transaction authority 700 may take international law into account -- with differing rules applying to

different countries. The rules could take into account various import and export requirements and restrictions, international tax treaties between nations, contain upfront and/or ongoing customs related routing and filing requirements, identify reputable currency transaction authorities, assist in filing contracts or certain contract terms with relevant national and international authorities, manage any shipping or other transportation requirements, assist in establishing conclusive translation services for contract terms (particularly standard terms and conditions), manage differences in international certifying authority requirements and formats, impose societal regulations required by applicable governing bodies, and collect applicable governing body taxes, such as taxes for both national and regional governing entities, etc. Transaction authority 700 may communicate between the various international parties using secure electronic containers, and may securely validate and authentic various event notifications provided by the international parties.

**Example: Distributed Transaction Authorities**

Complex business interactions under the control of a transaction authority 700 may also be distributed within and among, for example, organizations and/or jurisdictions. Suppose a complex international real estate transaction requires participation of several functions within the purchasing and selling companies, several financial institutions, insurance companies, and law firms, and perhaps government agencies in a few countries. Suppose further that each of the organizational and individual parties to the

transaction has computers that are VDE-aware, and that within each organization or agency there is at least one distributed transaction authority that performs services for this real estate transaction under an authority granted by a master transaction authority 700.

In this one example, each of the parties to the real estate transaction has contributed commerce rules and parameters representing their business relationships in the form of VDE rules and controls that define each parties role in the overall transaction. For instance, the insurance company must insure the property at a value and cost that the purchaser finds acceptable and that is also approved by the mortgage lender(s). Also, suppose that these transaction VDE rules and controls have already been mutually agreed upon using negotiation mechanisms described in the Ginter et al. application, and that the negotiated rules and controls together with the history of negotiating these rules and controls have all been stored at the master transaction authority for this real estate transaction. The most senior transaction authority may be a master transaction authority 700 or might be any mutually agreed upon distributed transaction authority. In this one example we assume the former. In short, in short, all parties have agreed to the rules and controls that govern the transaction. The negotiation process may have been simplified because the transaction authority 700 may have distributed a distributed template application for international real estate sales, the template being based on the transaction authority 700's past experience or that

were created by the transaction authority 700 especially for this transaction as a value added service to its important customers.

Each of the parties to the transaction is, according to the VDE control sets that define this atomic transaction, responsible  
5 for seeing that certain pieces of the transaction are completed prior to the closing and consummation of the overall transaction. In some cases, plural parties are jointly responsible for completing part of the over all transaction. For example, the buyer and seller must have agreed on a purchase price. In this example, they  
10 contribute their business requirements, including, for example, their price and other variables, and they use the VDE negotiation mechanisms to arrive at an agreement that represents a fair balance of interests. If the electronic negotiation is unsuccessful, the parties may directly negotiate, or VDE secure containers with  
15 audit records indicating failure are sent to the transaction authority who, in turn, notifies each of the other parties authorized to participate in the overall transaction.

If the buying and selling parties do agree, in this one example, notification is sent by the VDE protected processing  
20 environment that completes the negotiation (or receives negotiation completion instructions digitally signed by both parties through the use of VDE techniques) to a distributed transaction authority, which in turn, notifies other parties, including other participating transaction authorities, that price has  
25 been agreed upon. Based on VDE controls for subtransactions, VDE may securely notify a party or parties that certain other subtransactions are now to be completed. In this example, the title

search company may now perform their task; an insurance company may now begin negotiations with the buyer for coverage using the VDE negotiation mechanisms. An attorney in the Counsel's office for the purchaser may begin negotiations with his  
5 counterpart in the seller's company; both in-house attorneys may interact with their outside counsel using VDE and VDE secure containers in creating and negotiating the various documents whose execution completes parts or the overall transaction.

In this example, each of the parties may have one or more  
10 digital certificates issued by the certifying authority 500 to authenticate each of the parties to this transaction and its subtransactions. The financial clearinghouse 200 provides a payment vehicle for various value added services, in one example, those provided by the transaction authority 700. The usage  
15 clearinghouse 300 collects audit records sent from time to time in VDE secure containers from each of the participating VDE protected processing environments and provides an independent third party audit of these transactions. The secure directory services 600 helps participants locate each other's electronic  
20 addresses while maintaining confidentiality and privacy.

As each of the subtransactions is completed, a distributed transaction authority within the organization within which the subtransaction is completed notifies the master authority for this transaction 700 of completion of that subtask. According to the  
25 previously agreed upon VDE rules and controls sets, some or all of the persons participating in the transaction may also be notified by audit records and/or messages that are securely sent from, and

authenticated by, at least one participating VDE protected processing environment, including, for example, PPEs at nodes for individuals, distributed Commerce Utility Systems, a distributed transaction authority, and/or the master authority for this  
5 transaction.

When all the component elements of the overall transaction have completed, a transaction authority, in this example, the master transaction authority for this real estate sale, notifies each of the participants and each of the participating distributed  
10 transaction authorities, that the preconditions have all been met and settles the overall transaction. Optionally, the transaction authority may give seller and purchase a last opportunity to proceed to completion or to hold up the transaction.

This one example shows that Commerce Utility Systems 90,  
15 including transaction authority 700, may be distributed to intermediate VDE protected processing environments that support one or more Commerce Utility Systems 90.

#### **Example – Digital Broadcasting Network**

20 Amortizing infrastructure and other resources across many users, building critical mass more rapidly than competitors, supporting specialization to tailor and deliver the most appealing products and services to customers, maximizing negotiating leverage power for purchasing, and building the most  
25 comprehensive infrastructure to serve as the best “one-stop” resource for a given business activity -- these are all central

concepts in building successful, modern businesses. VDE and Distributed Commerce Utility provide a foundation for creating highly competitive and successful cyberspace businesses that demonstrate these attributes. Many of these businesses will reflect  
5 the character of the Internet and the World Wide Web. Like VDE and Distributed Commerce Utility, they will comprise a distributed community that realizes maximum advantage by supporting electronic commerce partnerships. They will provide different layers of services and complementary products and  
10 services, and will realize great advantage in coordinating their activities to their mutual benefit.

The Digital Broadcasting Network ("DBN") will be just such an innovative commercial enterprise. Comprised of many different World Wide Web ("WEB") based sites and services,  
15 DBN participants will gain greater leverage and operating efficiency by sharing resources, experiencing maximum buying power, generating marketing and customer information, and supporting a rational administrative overlay that ties together their many, frequently complementary, activities. Much like the  
20 consistent rules that enable and underlie both the World Wide Web and the design of VDE and Distributed Commerce Utility, and layered upon the capabilities of both these architectures, the Digital Broadcasting Network employs their inventions to support a highly efficient, largely automated and distributed community  
25 that maximizes business efficiencies. In a similar manner, other examples would include other groupings of entities that function together as Virtual Enterprises (e.g. corporations or other

organizations). The distributed nature of VDE and the Commerce Utility Systems are particularly important in providing an effective infrastructure for these modern, potentially large scale, cyberspace business activities.

- 5           The Digital Broadcasting Network may function as a cooperative of WEB sites and, for example, service providers, with a central and perhaps regional and logical (e.g. market based) headquarters groups, or it may function as a for profit, shareholder corporation in a business model reminiscent of television
- 10 broadcast companies (e.g., NBC), or it may function as a cooperative or virtual corporation that has some mix or combination of mixes of the above attributes and employ distributed peer to peer, hierarchical, and centralized administrative business relationships and activities. In one
- 15 example, a plurality of corporations may join together to provide the advantages of size and coordination with individual participants providing some degree of specialty expertise and the body of entities coordinating together in some fashion in a “higher” level cooperative or corporation.
- 20           In one example, the Digital Broadcasting Network may be a single corporation that has many licensed franchisees. The licensed franchisees may comprise WEB sites that serve geographically and/or logically specialized market areas and/or serve other WEB sites in a hierarchy and/or peer-to-peer context
- 25 of Distributed Commerce Utility services as described above. On behalf of itself *and* its franchisees, this corporation may, for example:

- negotiate optimal rates for exposure time with advertisers and their agents,
- obtain the lowest costs for content provided by third parties,
- 5      • resell market analysis and user profiling information,
- share its revenue with its franchisees which themselves may share revenue with DBN and/or other franchisees,
- provide advertising to franchisees in response to franchisee and/or franchisee user base profiles,
- 10      • guarantee a certain number of “eyes” (exposures and/or other interactions) with respect to advertiser materials,
- provide a secure virtual network employing VDE and Distributed Commerce Utility capabilities so that the overall organization can operate in a secure and highly
- 15      efficient manner, including using common user application tools, interfaces, and administration operations,
- do advertising for the network to the benefit of the network and the franchisees,
- 20      • purchase and/or otherwise supply content to franchisees in response to franchisee needs as demonstrated by their requests and/or usage profiles,
- collect and analyze content (including advertising) usage, cyberspace purchasing, and other data as allowed
- 25      under its agreement with franchisees,
- allow franchisees to perform many of the network functions on a local basis-- that is acquire and make

available geographically and/or logically local  
(consistent with there focus) content (and/or other  
content of particular interest to its user base),

- 5       • negotiate agreements regarding advertising materials that  
are of commercial value given the franchisees physical  
and/or logical market focus,
- 10       • control at least a portion of its WEB “broadcasting”  
space--that is exercise local control over at least some  
portion of the content --with the remainder of the  
control, by agreement, and, for example, enforced by  
rules and controls, being under the control of DBN  
and/or some one or more other network participants, and
- 15       • perform other administrative, support and/or service  
functions on behalf and/or for the network.

15       In one example, DBN may employ many of the security and  
administrative capabilities of VDE and many of the service  
functions provided by the present inventions to manage and  
automate the distributed relationships and activities that are  
central to the DBN business model. For example:

- 20       • Transaction Authority 700 can provide the overall  
administrative context for managing the network  
community. For example, the transaction authority 700  
may manage (through the use of VDE rules and controls  
in the preferred embodiment) the routing of content to  
25       appropriate franchisees. It may also manage the chains  
of handling and control related to reporting usage  
information. The transaction authority 700 may obtain

- and/or derive its electronic control sets from the agreement relationships between DBN and its franchisees. Electronic negotiations may be used to create these agreement relationships. The transaction authority 700 may also receive controls reflecting bilateral or other networked relationships directly among franchisees and other participants.
- 5
- Rights and Permissions Clearinghouse 400 can extend commercial rights related to content to network franchisees. It acts as a repository of rights related to content that is supplied by network entities to customers-  
10 -including content rights held by network entities themselves, and made available to other network entities. Such content rights may include, for example,  
15 displaying, vending, redistributing, repurposing, and for advertising. It can provide additional rights (e.g., redistribution rights or specialized repurposing rights) upon request and/or automated profiling based, for example, upon usage.
  - 20 • Usage Clearinghouse 300 can collect usage data in support of market analysis, user profiling, and advertising. It may also analyze that information and derive reports. It may distribute those reports internally to the DBN as appropriate, and sell reports and/or other  
25 usage based information externally based upon commercial opportunity.

- Financial Clearinghouse 200 can ensure proper compensation fulfillment throughout the network. It may collect payments due to DBN from franchisees for content. It may distribute to franchisees payments due  
5 them as a result of advertising and reselling of usage information. It can collect payments from franchisees for support of generally DBN infrastructure and services such as, for example, network advertising. It connects to  
10 general purpose financial clearinghouse infrastructure to transmit and receive payment related information.
- The secure directory services 600 may maintain directory services based upon unique identity and/or class attribute(s). There may be a very large number of franchisees globally. Directory services 600 could also  
15 maintain directory information on customers, including unique identifier and profiling information. Secure directory services 600 may maintain directory infrastructure for content owned, managed and/or available to the network.
- A certifying authority 500 may certify the roles of all participants in the network. It would issue a certificate to each franchisee, for example. It may also issue certificates certifying commercial relationships of  
20 groupings of network entities to facilitate efficient, secure relationships with third parties. They may also  
25 issue certificates to customers to represent certain specialized customer rights regarding customer

commercial activities with outside parties (for example, discounts, or being a member of the greater "DBN" community).

5 Portions or all of specific service functions (e.g., as described above) may be highly distributed and may operate significantly, primarily or even exclusively on franchise and service network web servers.

\* \* \* \* \*

10 While the inventions have been described in connection with what is presently considered to be the most practical and preferred embodiment, it is to be understood that the inventions are not to be limited to the disclosed embodiment, but on the contrary, are intended to cover various modifications and  
15 equivalent arrangements included within the spirit and scope of the appended claims.

## WHAT IS CLAIMED IS:

1. An electronic commerce and/or rights management system for performing at least one clearing operation, the system comprising:
  - a first electronic appliance (100),
  - 5 a second electronic appliance (100'), and
  - an electronic communications network (150) that allows the first and second electronic appliances (100, 100') to exchange digital signals,
  - characterized in that:
    - 10 the first electronic appliance (100) performs at least a first part of the clearing operation, and
    - the second electronic appliance (100') performs at least a second part of the clearing operation.
2. An electronic commerce and/or rights management system as in  
15 claim 1 further characterized in that the first part of the clearing operation includes at least one micropayment aggregation task, and the second part of the clearing operation includes at least one payment settlement task.
3. An electronic commerce and/or rights management system as in  
20 claim 1 further characterized in that that the first electronic appliance (100) comprises a consumer appliance, and the second electronic appliance (100') is installed, at least in part, within a clearing institution.
4. An electronic commerce and/or rights management system as in  
claim 1 further characterized in that at least the first electronic appliance (100) includes a protected processing environment (154).
- 25 5. An electronic commerce and/or rights management system as in claim 1 further characterized in that the first part of the clearing operation comprises a usage metering task (116).
6. An electronic commerce and/or rights management system as in  
30 claim 1 further characterized in that the first part of the clearing operation comprises at least one task conditioned on a digital certificate (504).

claim 1 further characterized in that the first part of the clearing operation comprises at least one rights management task.

8. An electronic commerce and/or rights management system as in  
5 claim 1 further characterized in that the first part of the clearing operation comprises at least one electronic currency management task.

9. An electronic commerce and/or rights management system as in claim 1 further characterized in that most of the clearing operation is performed by the first appliance (100).

10 10. An electronic commerce and/or rights management system as in claim 1 further characterized in that most of the clearing operation is performed by the second appliance (100').

11. An electronic commerce and/or rights management system as in claim 1 further characterized in that the system further includes a third  
15 electronic appliance (100'') coupled to at least one of the first and second electronic appliances (100, 100') through the network (150), the third electronic appliance performing a third part of the clearing operation.

12. An electronic commerce and/or rights management system as in claim 1 further characterized in that each of the first and second appliances  
20 (100, 100') are capable of performing any of a financial clearing operation, a usage clearing operation, a rights and permissions clearing operation, a certifying authority operation, a transaction authority operation, and a secure directory services operation, and each of said operations may be distributed in different ways between the first and second appliances (100, 100').

25 13. An electronic commerce and/or rights management system as in claim 1 further characterized in that the electronic network (150) couples the first and second electronic appliances (100, 100') to a commerce utility system web.

14. An electronic commerce and/or rights management system as in  
30 claim 1 further characterized in that an electronic rights holder can electronically choose between the first electronic appliance (100) and the second electronic appliance (100').

claim 1 further characterized in that the first and second electronic appliances (100, 100') work together to perform overall transaction clearing.

5       16. An electronic commerce and/or rights management system as in claim 1 further characterized in that each of the first and second appliances (100, 100') performs each of: at least one financial clearing operation, at least one usage clearing operation, at least one rights and permissions clearing operation, at least one certifying authority operation, at least one transaction authority operation, and at least one secure directory services operation.

10       17. An electronic commerce and/or rights management system as in claim 1 further characterized in that the first electronic appliance (100) comprises a hierarchy of plural commerce utility systems (90(1), ... 90(n)).

15       18. An electronic commerce and/or rights management system as in claim 1 further characterized in that the first electronic appliance (100) is organization-specific.

19. An electronic commerce and/or rights management system as in claim 1 further characterized in that the first electronic appliance (100) is vertically specialized.

20       20. An electronic commerce and/or rights management system as in claim 1 further characterized in that the first electronic appliance (100) is specialized by territory and/or jurisdiction.

21. An electronic commerce and/or rights management system as in claim 1 further characterized in that the first and second electronic appliances (100, 100') communicate and coordinate as peers and in a hierarchy.

25       22. An electronic commerce and/or rights management system as in claim 1 further characterized in that that clearing operation includes processing payment related information, and performing at least one payment related transaction.

30       23. An electronic commerce and/or rights management system as in claim 1 further characterized in that that clearing operation includes processing usage related information and performing at least one usage reporting action.

claim 1 further characterized in that that clearing operation includes receiving at least one request, and performing at least one associated rights management transaction.

5           25. An electronic commerce and/or rights management system as in claim 1 further characterized in that that clearing operation includes issuing at least one digital certificate.

          26. An electronic commerce and/or rights management system as in claim 1 further characterized in that that clearing operation includes securely  
10 providing directory information.

          27. An electronic commerce and/or rights management system as in claim 1 further characterized in that that clearing operation includes performing at least one process management transaction.

          28. An electronic commerce and/or rights management system as in  
15 claim 1 whether the first and second parts of the clearing operation support one another.

          29. An electronic commerce and/or rights management system as in claim 1 wherein at least one of the first and second electronic appliances (100, 100') includes a rights operating system that supports a collection of service  
20 application components defining at least one service function.

**AMENDED CLAIMS**

[received by the International Bureau on 5 January 1998 (05.01.98);  
original claims 1-29 replaced by new claims 1-233 (59 pages)]

1. A method for supporting a distributed commerce utility, wherein said method comprises the steps of:

- a. Establishing a central clearinghouse arrangement;
- b. Establishing plural, distributed clearinghouse nodes remote from said central clearinghouse arrangement, said distributed clearinghouse nodes securely communicating with said central clearinghouse arrangement;
- c. Performing digital information usage audit functions at one or more of said remote clearinghouse nodes;
- d. Maintaining at said one or more remote clearinghouse nodes, a database containing a local store of information related to multiple uses of digital information;
- e. Transmitting information representative of said multiple uses of digital information from said database(s) to said central clearinghouse arrangement; and
- f. Securely managing at least one aspect of said uses of said digital information at said one or more remote clearinghouse nodes in response to at least a portion of said local store of information and rules and controls securely and separately supplied by said clearinghouse arrangement and at least one third party digital information rightsholder.

2. A method for creating a cooperative, distributed rights management commercial arrangement, wherein said method comprises the steps of:

- a. Establishing plural commerce service arrangements for the performance of system services comprising two or more of (1) financial clearing, (2) usage information clearing, (3) rights and permissions clearing, (4) certificate authority services, (5) directory

17. A method for operating a rights repository system, said method comprising the steps of:

- a. Distributing protected commerce nodes for use by participants in commercial processes;
- b. Maintaining a rights repository arrangement remotely from end-user participants;
- c. Receiving at least in part protected digital information at an end-user participant commerce node; and
- d. Enabling said end-user participant node to securely, separately receive rights permission information from said remote rights repository to, at least in part, enable a desired usage of at least a portion of said digital information at said end-user participant commerce node.

18. A method for mixed commerce infrastructure, said method comprising the steps of:

- a. Employing plural, distributed commerce utility systems, said systems operated by plural parties that provide trusted commerce services;
- b. Employing plural, distributed, trusted commerce appliances to support end-user electronic commerce activity;
- c. Securely conveying digital information between end-user commerce appliances and at least one commerce utility system;
- d. Securely conveying digital information between two or more of said commerce utility systems; and
- e. Securely conveying digital information between two or more of said end-user commerce appliances.

19. A method for supporting a hierarchical commerce infrastructure, said method comprising the steps of:

- a. Establishing trusted, distributed commerce appliances;

services, (6) advertising management services, (7) repository, archiving, back-up and restore, and/or non-repudiation services, (8) certifying services validating that digital information and/or events have satisfied applicable commerce rules and controls, (9) managing distributed transaction processing in accordance with applicable commerce rules and controls, and (10) user and/or class profiling and/or marketing analysis including assisting in the direction of digital information to one or more specific parties and/or class of parties:

- b. Establishing interoperability standards enabling secure, cooperative use of said plural service arrangements;
- c. Providing plural system services through use of said plural service arrangements for use by digital information rightsholders; and
- d. Securely supporting electronic commerce at a value chain participant node at least in part through the use of system services provided by said plural commerce service arrangements.

3. A method for supporting a distributed commerce arrangement comprising the steps of:

- a. Supporting multiple, separately operated service arrangements for the performance of electronic commerce support services;
- b. Providing digital information for use by end-users operating within said distributed commerce arrangements;
- c. Passing digital information reflecting end-user use of said digital information to plural of said separately operated service arrangements; and
- d. Passing digital information reflecting end-user use of said digital information from at least one of said separately operated service arrangements to at least one other of said separately operated service arrangements.

4. A method for directing the movement of digital information among participants in a rules and controls managed electronic commerce arrangement comprising the steps of:

- a. Establishing the identity of plural participants in a distributed electronic commerce arrangement;
- b. Acquiring user profile and/or preference information;
- c. Conveying said information to a commerce service center;
- d. Directing other digital information to an arrangement participant based at least in part upon said profile and/or preference information; and
- e. Ensuring satisfaction of requirements specified by at least one rightsholder having rights in said directed digital information, through use, at least in part, of rules and controls specified by said at least one rightsholder.

5. A method for supporting a rules and controls based, distributed commerce arrangement, comprising the steps of:

- a. Establishing plural, separate commerce service providers;
- b. Establishing plural, separate value chain end-users;
- c. Supporting, at least in part securely, differing value chains made up of value chain participants comprising different combinations of plural, separate authorized commerce service providers and plural authorized end-users; and
- d. Transferring digital information securely between one or more end-user sites and plural, separate commerce service providers in response to commerce rules and controls established by one or more of said value chain participants.

6. A method for exchanging digital information within a distributed, secure, electronic commerce arrangement, comprising the steps of:

- a. Establishing unique identities for participants within an electronic commerce arrangement, wherein said participants comprise commerce utility service providers, product and/or information service providers, and product and/or information service users;
- b. Securely delivering a first type of digital information between an arrangement participant A and an arrangement participant B;
- c. Securely delivering a second type of digital information between said arrangement participant B and an arrangement participant C;
- d. Securely delivering a third type of digital information between arrangement participant C and arrangement participant D; and
- e. Protecting participant rights at least in part through programmable, secure, rules and controls based governance of use of said types of digital information delivered to, and used by, said participants B and C;

wherein each of said types of digital information comprise one of: (1) digital content, (2) usage information related to usage of said digital content, (3) instructions used in fulfilling an electronic payment related to usage of said digital content, (4) electronic currency, (5) rules and controls, and (6) profiling and/or preference information of an arrangement participant.

7. A method for receiving value in response to an electronic event, said method comprising:

- a. Establishing a distributed computing environment supporting peer-to-peer, securely interoperable participant nodes;
- b. Specifying requirements that are securely associated with digital events for at least in part managing the processing of said events at least in

part within protected processing environments located at said participant nodes;

- c. Processing a digital event at least in part within a protected processing environment at a first participant's node at least in part in response to an event request authorized by said first participant;
- d. Requiring compensation from said first participant based, at least in part, on the processing of said digital event at said first participant's node; and
- e. Requiring compensation from a second environment participant based, at least in part, on providing usage information related to said digital event.

8. A method for establishing identity characteristics for automating electronic commerce processes, wherein said method comprises the steps of:

- a. Establishing a unique identifier for a participant and/or a participant commerce installation;
- b. Securely issuing a first digital credential that identifies a first characteristic of said participant and/or participant installation;
- c. Securely issuing a second digital credential that identifies a second characteristic of said participant and/or participant installation;
- d. Associating plural characteristic identifying digital credentials with certain digital information and/or electronic events for usage governance;
- e. Requesting at least one form of digital processing of said digital information;
- f. Testing for the presence of said first and second digital credentials; and
- g. Responding to said request based at least in part on said test, wherein said responding to said request is governed at least in part by secured processes operating within said participant's installation.

9. A method for establishing an interoperable, peer-to-peer commerce arrangement, wherein said method enables peers to perform certificate authority functions, said method comprising the steps of:

- a. Installing securely interoperable commerce nodes at end-user sites;
- b. Enabling multiple commerce node end-users to each separately issue certificates to other commerce node end-users and/or end-user installations; and
- c. Enabling a digital information rightsholder and/or said end-user certificate issuer to at least in part manage usage rights related to certain digital information as a result of said rightsholder and/or said end-user certificate issuer associating one or more said rightsholder and/or end-user issued certificates with certain processing of said digital information.

10. A method for supporting a distributed trust platform, said method comprising the steps of:

- a. Securely installing, through a secure install arrangement, end-user electronic commerce installations of said distributed trust platform;
- b. Securely establishing a unique site identifier;
- c. Securely managing, at least in part through use of said unique site identifier, software installation and/or software updating;
- d. Securely associating rules and controls with certain digital information;
- e. Securely distributing said digital information for use at said end-user electronic commerce installations; and
- f. Controlling use of at least a portion of said digital information in response to said associated rules and controls.

11. A method for reporting electronic commerce event, user profiling, and surveying information, said method comprising the steps of:

- a. Monitoring usage of digital information at distributed electronic commerce nodes;
- b. Securely communicating information related to said monitored usage from at least one of said commerce nodes to at least one commerce utility system service;
- c. In accordance with rules and controls, at least one portion of said reported usage related information not being provided in useable form to said system service; and
- d. In accordance with rules and controls related to said communicated usage related information, electronically communicating at least a portion of said not usable information to a digital information rightsholders.

12. A method for distributed micro-transaction auditing and processing, said method comprising the steps of:

- a. Installing protected, distributed commerce nodes for auditing usage of digital information;
- b. Managing micro-payment related activity related to said usage of digital information at a commerce node based, at least in part, on control information provided by a first party; and
- c. Securely reporting information reflecting said commerce node auditing of usage information from said commerce node to a commerce utility system based, at least in part, on control information provided by a second party different from said first party.

13. A method for transaction authority management of distributed commercial activities, said method comprising the steps of:

- a. Employing a transaction authority to assist in the governance of a distributed commercial process;
- b. Participating by plural parties in a distributed commercial process via electronic instructions; and
- c. Governing, at least in part, said distributed commercial process through the use of secure control information contributed by said transaction authority and, at least in part, through the use of peer-to-peer commercial participant secure commerce nodes.

14. A method for operating a distributed electronic security checkpoint system, said method comprising the steps of:

- a. Employing distributed checkpoint electronic switches in a communications network;
- b. Communicating through said network, at least in part secured digital information provided by a first commercial party, said secured digital information to be at least in part received by at least one of said checkpoint electronic switches;
- c. Interacting with at least a portion of said received secured information through operation of at least one of said checkpoint electronic switches to: (1) acquire information related to said secured information, and/or (2) certify, authenticate, validate, and/or otherwise assert and/or test said information so as to provide a trusted commerce service; and
- d. Further communicating at least a portion of said secured digital information from said distributed checkpoint electronic switch to a second, remotely located commercial party different from said first commercial party.

15. A method for operating a digital broadcasting network, said method comprising the steps of:

- a) Securely providing digital information to plural participants in a cooperative arrangement of network information hosting and/or other service parties;
- b) Basing variables related to said digital information provided by step (a), at least in part upon specific attributes of each said party and/or classes of said parties;
- c) Commercially redistributing at least a portion of said digital information from at least certain of said parties to further parties; and
- d) Representing said cooperative arrangement to directly and/or electronically negotiate compensation arrangements related to said provision of digital information.

16. A method for supporting a secure messaging system, said method comprising the steps of:

- a. Packaging digital information at least in part securely in an electronic container for transmission by a first party to at least one additional party;
- b. Employing a directory service to provide electronic address information to direct said container to said at least one additional party;
- c. Transmitting said container to said at least one additional party;
- d. Providing authentication for at least a part of said digital information and/or for said secure container; and
- e. Preventing said first party from effectively denying that said first party sent at least a portion of said digital information and/or said container to said at least one additional party.

b. Establishing a programmed hierarchical rights management relationship between plural of said distributed commerce appliances and/or users of said distributed commerce appliances; and

c. Separately producing, at least in part in combination with at least a portion of said programmed hierarchical rights relationship and at least in part by the action of a hierarchically more senior: (1) distributed commerce appliance, (2) user using a distributed commerce appliance, (3) distributed commerce appliance and user, or (4) plurality of any one or more of (1), (2), and (3) in combination, control information for specifically managing specific activities performed by hierarchically less senior said distributed commerce appliances and/or users of said distributed commerce appliances.

20. A method for supporting a hierarchical commerce utility system infrastructure, said method comprising the steps of:

a. Establishing a first trusted commerce utility system;

b. Establishing a second trusted commerce utility system hierarchically less senior than said first trusted commerce utility system;

c. Securely communicating control information between said first and second commerce utility systems;

d. Establishing trusted end-user commerce nodes; and

e. Performing by said second commerce utility system a commerce utility service function servicing at least one of said end-user commerce nodes, wherein said service operates at least in part in accordance with said securely communicated control information.

21. A method for supporting a virtual computer, said method comprising the steps of:

a. Establishing distributed commerce nodes;

b. Establishing a trusted commerce utility system to at least in part manage use rights related to resources available at one or more of said distributed commerce nodes;

c. Establishing use rights information to at least in part govern use of physical and/or logical resources available for use at, at least one of, said one or more distributed commerce nodes;

d. Securely communicating at least a portion of said use rights information to said at least one of said distributed commerce nodes; and  
Employing resources at said at least one of said distributed commerce nodes for use in a virtual computing arrangement based, at least in part, on said use rights information.

22. A method for supporting virtual, networked banking activities, said method comprising the steps of:

a. Enabling plural banking arrangements that comprise a web of separately managed protected processing environments;

b. Communicating control information securely between plural of said separately managed protected processing environments;

c. Governing one or more banking activities, by at least in part managing interacting electronic processes, at least in part operating under the control of plural said banking arrangements' protected processing environments, where said processes are managed by rules and controls and are related to one or more of: (1) the electronic storage of currency, (2) the right to lend money to at least one participant, (3) the fulfillment of payment obligations, (4) the management of electronic bills and/or other obligations, and (5) the ability to deliver or otherwise communicate one or more currency objects.

23. A method for supporting payment settlement related, at least in part, to electronically rights managed electronic commerce, said method comprising the steps of:

- a. Enabling a financial clearinghouse employing at least one protected processing environment to securely receive payment related information from distributed electronic commerce nodes located at remote end-user sites;
- b. Securely receiving at said clearinghouse payment related information from at least one of said distributed electronic commerce nodes;
- c. Processing, within at least one protected processing environment at said clearinghouse, at least a portion of said payment related information including governing payment fulfillment at least in part based upon electronic rights management control information processed ; and
- d. Securely communicating payment fulfillment information to at least one of (1) a payment fulfillment organization, and (2) an intended recipient of payment, wherein said payment fulfillment organization and/or intended recipient of payment at least in part employ a protected processing environment to access said payment fulfillment information.

24. A method for supporting a fulfillment server, said method comprising the steps of:

- a. Establishing a fulfillment server for efficiently managing, at least in part, electronic requests;
- b. Securely receiving electronic request information from a distributed, secure electronic commerce node;
- c. Securely receiving from a remote location rule based control information securely associated with said electronic request information, said control information operating with fulfillment server control information to form at least one control set;

- d. Testing to determine what action should be taken with respect to said request information, through the use of at least a portion of said control set;
- e. Securely responding to said distributed electronic commerce node to provide feedback regarding said request information; and
- f. Processing, in accordance with at least a portion of said at least one control set, a request described by said request information, by one or more of: (a) fulfilling said request, (b) partially fulfilling said request, (c) not fulfilling said request and (d) seeking further information related to said request.

25. A method for supporting delegated electronic rights, said method comprising the steps of:

- a. Establishing distributed trusted electronic commerce nodes for use by plural separate parties;
- b. Associating a digital credential with one or more parties and/or nodes, where said credential, in combination with protected control information, provides the right to said one or more parties and/or nodes to electronically represent and/or exercise rights possessed by one or more other parties and/or nodes; and
- c. Enabling said provision of at least one right to represent and/or exercise, at least in part, through the use of electronic control information including governing said right to represent and/or exercise by processing at least a portion of said control information in at least one trusted electronic commerce node.

26. A method for supporting a virtual entity, said method comprising the steps of:

- a. Installing distributed, trusted electronic commerce nodes for use by plural parties;
- b. Issuing digital credentials to plural parties and/or nodes to, at least in part, represent the identity of said parties and/or nodes;

- c. Securely communicating, among said plural parties and/or nodes, digital information related to at least in part the identity of said parties and/or nodes;
- d. Securely creating, within one or more said trusted electronic commerce nodes, one or more digital credentials that represents a virtual entity that comprises a cooperative participation among said plural parties and/or nodes for one or more commercial purposes; and
- e. Employing at least one of said one or more credentials representing said virtual entity to, at least in part, enable said virtual entity to at least in part participate in at least one commercial process

27. A method for securely electronically delivering digital information, said method comprising the steps of:

- a. Securely communicating selected digital information between two or more participant parties supported by at least one trusted service provider participants, all said participants employing protected electronic environments, wherein said trusted provider supports archiving and/or authenticating of transaction related information;
- b. Securely generating secure control information at two or more of said trusted electronic environments;
- c. Securely governing at least a portion of said communicating and use of said selected, communicated digital information through use of said generated control information;
- d. Storing information related to communication and/or usage of said communicated digital information at each participant site; and
- e. Performing by said service provider participant trusted archival and/or authentication services related to said selected digital information

28. A method for reporting electronic commerce event, user profiling, and surveying information, said method comprising the steps of:

- a. Monitoring usage of digital information at one or more distributed electronic commerce nodes;
- b. Collecting user profiling and/or survey information;
- c. Securely reporting information related to said user profiling and/or surveying from at least one said commerce nodes to at least one commerce utility system services; and
- d. In accordance with rules and controls associated with said communicated profile and/or survey related information, electronically instructing said system service to electronically communicate to at least one digital information rightsholder, certain of said user profiling and surveying information related to usage.

29. A method for supporting a third party certification authority, said method comprising the steps of:

- a. Operating a trusted third party certification authority arrangement;
- b. Operating three or more electronic commerce participant sites;
- c. Certifying by said trusted certification authority arrangement at least one commercial capability, commitment, and/or other attribute possessed by and/or involving at least two of said three or more electronic commerce participant sites and/or users of said sites;
- d. Securely providing a digital credential resulting from step c. to at least one electronic commerce participant site different from said electronic commerce participant sites involved in step c; and
- e. Employing said digital credential at said at least one different electronic commerce participant site in the performance of a commercial activity.

30. A method for coupling trusted and untrusted activities at a trusted service provider, said method comprising the steps of:

- a. Operating plural end user commerce nodes;
- b. Operating plural trusted service provider arrangements for at least in part supporting commercial activities related to said commerce nodes;
- c. Employing a computer operating environment for each of such trusted service provider arrangements;
- d. Employing at least one trusted system component within such operating environments, wherein at least certain internal operations of said components are concealed from such service providers; and
- e. Performing at least one concealed process within such internal trusted component, wherein such concealed process is operatively coupled to at least one process at such trusted service provider arrangement that occurs external to said trusted component and is not concealed.

31. A method as in claim 1 further including allowing an end user to choose between different central clearinghouse arrangements.

32. A method as in claim 1 further including the step of implementing said plural, distributed clearinghouse nodes using protected processing environments that employ a secure processing unit and/or a tamper-resistant software environment.

33. A method as in claim 1 further including the step of implementing said plural, distributed clearinghouse nodes using secure databases.

34. A method as in claim 1 further including the step of implementing said central clearinghouse arrangement using a protected processing environment

that employs a secure processing unit and/or a tamper-resistant software environment.

35. A method as in claim 1 further including the step of implementing said central clearinghouse arrangement using a secure database.

36. A method as in claim 2 further including allowing an end user to choose among said plural service arrangements.

37. A method as in claim 2 further including the step of implementing said value chain participant node using a protected processing environment that employs a secure processing unit and/or a tamper-resistant software environment.

38. A method as in claim 2 further including the step of implementing said value chain participant node using a secure database.

39. A method as in claim 2 further including the step of implementing said plural commerce service arrangements using protected processing environments that employ secure processing units and/or a tamper-resistant software environments.

40. A method as in claim 2 further including the step of implementing said plural commerce service arrangements using secure databases.

41. A method as in claim 3 further including allowing at least one of said end-users to choose among said separately operated service arrangements.

42. A method as in claim 3 further including the step of implementing end user electronic nodes using protected processing environments that employ secure processing units and/or a tamper-resistant software environments.

43. A method as in claim 3 further including the step of implementing end user electronic nodes using secure databases.

44. A method as in claim 3 further including the step of implementing said separately operated service arrangements using at least one protected processing environment that employs a secure processing unit and/or a tamper-resistant software environment.

45. A method as in claim 3 further including the step of implementing said separately operated service arrangements using secure databases.

46. A method as in claim 4 further including allowing at least one of said plural participants to choose among different commerce service centers.

47. A method as in claim 4 further including the step of implementing end user electronic nodes using a protected processing environments that employ secure processing units and/or a tamper-resistant software environments.

48. A method as in claim 4 further including the step of implementing end user electronic nodes using secure databases.

49. A method as in claim 4 further including the step of implementing said commerce service center using at least one protected processing environment that employs a secure processing unit and/or a tamper-resistant software environment.

50. A method as in claim 4 further including the step of implementing said commerce service center using at least one secure database.

51. A method as in claim 5 further including allowing at least one end user to choose among said plural, separate commerce service providers.

52. A method as in claim 5 further including the step of implementing said one or more end user sites using protected processing environments that employ secure processing units and/or tamper-resistant software environments.

53. A method as in claim 5 further including the step of implementing said one or more end user sites using secure databases.

54. A method as in claim 5 further including the step of implementing said plural, separate commerce service providers using protected processing environments that employ secure processing units and/or tamper-resistant software environments.

55. A method as in claim 5 further including the step of implementing said plural, separate commerce service providers using secure databases.

56. A method as in claim 6 further including allowing at least one of said product and/or information service users to choose among different ones of said commerce utility service providers, and/or product and/or information service providers.

57. A method as in claim 6 further including the step of providing to each of said product and/or information service users, protected processing

environments that employ secure processing units and/or tamper-resistant software environments.

58. A method as in claim 6 further including the step of maintaining a secure database for each of said product and/or information service users.

59. A method as in claim 6 further including the step of providing to said commerce utility service providers, and/or product and/or information service providers, protected processing environments that employ secure processing units and/or tamper-resistant software environments.

60. A method as in claim 6 further including the step of providing to said commerce utility service providers, and/or product and/or information service providers, secure databases.

61. A method as in claim 7 further including the step of implementing said peer-to-peer, securely interoperable participant nodes with protected processing environments that employ secure processing units and/or tamper-resistant software environments.

62. A method as in claim 7 further including the step of implementing said peer-to-peer, securely interoperable participant nodes using secure databases.

63. A method as in claim 8 further including the step of implementing said participant installation with a protected processing environment that employs a secure processing unit and/or a tamper-resistant software environment.

64. A method as in claim 8 further including the step of implementing said participant installation using a secure database.

65. A method as in claim 8 wherein at least one of said first and second digital credentials comprises a digital certificate.

66. A method as in claim 9 further including the step of implementing said securely interoperable commerce nodes with protected processing environments that employ secure processing units and/or tamper-resistant software environments.

67. A method as in claim 9 further including the step of implementing said securely interoperable commerce nodes using secure databases.

68. A method as in claim 10 further including the step of implementing said end-user electronic commerce installations with protected processing environments that employ secure processing units and/or tamper-resistant software environments.

69. A method as in claim 10 further including the step of implementing said end-user electronic commerce installations using secure databases.

70. A method as in claim 11 further including allowing an end user of at least one of said distributed electronic commerce nodes to choose among plural said commerce utility systems.

71. A method as in claim 11 further including the step of implementing said distributed electronic commerce nodes with protected processing environments that employ secure processing units and/or tamper-resistant software environments.

72. A method as in claim 11 further including the step of implementing said distributed electronic commerce nodes using secure databases.

73. A method as in claim 11 further including the step of implementing said commerce utility systems with protected processing environments that employ secure processing units and/or tamper-resistant software environments.

74. A method as in claim 11 further including the step of implementing said commerce utility systems using secure databases.

75. A method as in claim 12 further including allowing an end user of at least one of said protected, distributed commerce nodes, to choose among plural said commerce utility systems.

76. A method as in claim 12 further including the step of implementing said protected, distributed commerce nodes with protected processing environments that employ secure processing units and/or tamper-resistant software environments.

77. A method as in claim 12 further including the step of implementing said protected, distributed commerce nodes using secure databases.

78. A method as in claim 12 further including the step of implementing said commerce utility system with a protected processing environment that employs a secure processing unit and/or a tamper-resistant software environment.

79. A method as in claim 12 further including the step of implementing commerce utility systems using secure databases.

80. A method as in claim 13 further including allowing an end user of said commercial participant secure commerce nodes, to choose among plural said transaction authorities.

81. A method as in claim 13 further including the step of implementing said commercial participant secure commerce nodes with protected processing environments that employ secure processing units and/or tamper-resistant software environments.

82. A method as in claim 13 further including the step of implementing said commercial participant secure commerce nodes using secure databases.

83. A method as in claim 13 further including the step of implementing transaction authorities with protected processing environments that employ secure processing units and/or tamper-resistant software environments.

84. A method as in claim 13 further including the step of implementing transaction authorities using secure databases.

85. A method as in claim 14 further including allowing at least one of said commercial parties to choose among plural distributed checkpoint electronic switch services.

86. A method as in claim 14 further including the step of implementing said distributed checkpoint electronic switches with protected processing environments that employ secure processing units and/or tamper-resistant software environments.

87. A method as in claim 14 further including the step of implementing said distributed checkpoint electronic switches using secure databases.

88. A method as in claim 15 further including allowing at least one of said parties to choose among plural of cooperative arrangements.

89. A method as in claim 15 further including the step of implementing said cooperative arrangement with a protected processing environment that employs a secure processing unit and/or a tamper-resistant software environment.

90. A method as in claim 15 further including the step of implementing said cooperative arrangement using a secure database.

91. A method as in claim 16 further including allowing said additional party to choose among plural secure messaging systems.

92. A method as in claim 16 further including the step of implementing said secure messaging system with a protected processing environment that employs a secure processing unit and/or a tamper-resistant software environment.

93. A method as in claim 16 further including the step of implementing said secure messaging system using a secure database.

94. A method as in claim 17 further including allowing an end user participants to choose among plural said rights repository arrangements.

95. A method as in claim 17 further including the step of providing said end user participants with protected processing environments that employ secure processing units and/or tamper-resistant software environments.

96. A method as in claim 17 further including the step of providing said end user participants with secure databases.

97. A method as in claim 17 further including the step of implementing said rights repository arrangements with protected processing environments that employ secure processing units and/or tamper-resistant software environments.

98. A method as in claim 17 further including the step of implementing said rights repository arrangements using secure databases.

99. A method as in claim 18 further including allowing an end-user to choose among plural said commerce utility systems.

100. A method as in claim 18 further including the step of implementing said commerce utility systems with protected processing environments that employ secure processing units and/or tamper-resistant software environments.

101. A method as in claim 18 further including the step of implementing said commerce utility systems using secure databases.

102. A method as in claim 19 further including the step of implementing said distributed commerce appliances with protected processing environments that employ secure processing units and/or tamper-resistant software environments.

103. A method as in claim 19 further including the step of implementing said distributed commerce appliances using secure databases.

104. A method as in claim 19 wherein said trusted, distributed commerce appliances employ protected processing units.

105. A method as in claim 20 further including allowing an end-user to choose among plural said commerce utility systems.

106. A method as in claim 20 further including the step of implementing said commerce utility systems with protected processing environments that employ secure processing units and/or tamper-resistant software environments.

107. A method as in claim 20 further including the step of implementing said commerce utility systems using secure databases.

108. A method as in claim 21 further including the step of implementing said distributed commerce nodes with protected processing environments that employ secure processing units and/or tamper-resistant software environments.

109. A method as in claim 21 further including the step of implementing said distributed commerce nodes using secure databases.

110. A method as in claim 22 further including allowing an end user of a protected processing environment to choose amongst commerce utility service providers.

111. A method as in claim 22 further including implementing said protected processing environments with secure processing units and/or a tamper-resistant software environments.

112. A method as in claim 22 further including providing a secure database at each of said protected processing environments.

113. A method as in claim 23 further including allowing an end user to choose among plural financial clearinghouses.

114. A method as in claim 23 further including implementing said protected processing environments with secure processing units and/or tamper-resistant software environments.

115. A method as in claim 23 further including providing secure databases at each of said protected processing environments.

116. A method as in claim 23 further including the step of implementing financial clearinghouses with protected processing environments that employ secure processing units and/or tamper-resistant software environments.

117. A method as in claim 23 further including the step of implementing financial clearinghouses using secure databases.

118. A method as in claim 24 further including allowing an end user of said distributed electronic commerce node to choose between plural fulfillment servers.

119. A method as in claim 24 further including the step of implementing said distributed electronic commerce node with a protected processing environment that employs a secure processing unit and/or a tamper-resistant software environment.

120. A method as in claim 24 further including the step of implementing said distributed electronic commerce node using a secure database.

121. A method as in claim 24 further including the step of implementing said fulfillment server with a protected processing environment that employs a secure processing unit and/or a tamper-resistant software environment.

122. A method as in claim 24 further including the step of implementing said fulfillment server using a secure database.

123. A method as in claim 25 further including the step of implementing said distributed trusted electronic commerce nodes with protected processing environments that employ secure processing units and/or tamper-resistant software environments.

124. A method as in claim 25 further including the step of implementing said distributed trusted electronic commerce nodes using secure databases.

125. A method as in claim 26 further including the step of implementing said distributed trusted electronic commerce nodes with protected processing environments that employ secure processing units and/or tamper-resistant software environments.

126. A method as in claim 26 further including the step of implementing said distributed trusted electronic commerce nodes using secure databases.

127. A method as in claim 27 further including allowing at least one of said participant parties to choose among plural ones of said at least one trusted service provider participants.

128. A method as in claim 27 further including the step of providing to said participant parties, protected processing environments that employ secure processing units and/or tamper-resistant software environments.

129. A method as in claim 27 further including the step of providing secure databases in protected electronic environments to participant parties.

130. A method as in claim 27 further including the step of providing to said trusted service provider participants, protected electronic environments that employ secure processing units and/or tamper-resistant software environments.

131. A method as in claim 27 further including the step of providing secure databases to said at least one trusted service provider participant.

132. A method as in claim 28 further including allowing end users of said distributed electronic commerce nodes to choose among said at least one commerce utility system services.

133. A method as in claim 28 further including the step of implementing said distributed electronic commerce nodes with protected processing environments that employ a secure processing units and/or tamper-resistant software environments.

134. A method as in claim 28 further including the step of implementing said distributed electronic commerce nodes using secure databases.

135. A method as in claim 28 further including the step of implementing said at least one commerce utility system services with protected processing

environments that employ secure processing units and/or tamper-resistant software environments.

136. A method as in claim 28 further including the step of implementing said at least one commerce utility system services using secure databases.

137. A method as in claim 29 further including allowing participants to choose among plural trusted certification authority arrangements.

138. A method as in claim 29 further including the step of implementing said electronic commerce participant sites with protected processing environments that employ secure processing units and/or tamper-resistant software environments.

139. A method as in claim 29 further including the step of implementing said electronic commerce participant sites using secure databases.

140. A method as in claim 29 further including the step of implementing said trusted certification authority arrangement with a protected processing environment that employs a secure processing unit and/or a tamper-resistant software environment.

141. A method as in claim 29 further including the step of implementing said trusted certification authority arrangement using a secure database.

142. A method as in claim 30 further including allowing an end user of at least one of said plural end user commerce nodes to choose among plural trusted service provider arrangements.

143. A method as in claim 30 further including the step of implementing said plural end user commerce nodes with protected processing environments that employ secure processing units and/or tamper-resistant software environments.

144. A method as in claim 30 further including the step of implementing said plural end user commerce nodes using secure databases.

145. A method as in claim 30 further including the step of implementing said computer operating environments with protected processing environments that employ secure processing units and/or tamper-resistant software environments.

146. A method as in claim 30 further including the step of providing said computer operating environments with secure databases.

147. A method as in any one of the preceding claims further including performing a negotiation process that supports bidding, auctions or electronic contracts.

148. A method as in any one of the preceding claims further including the step of supporting a secure multiparty negotiation process.

149. A method as in any one of the preceding claims further including the step of supporting the independent delivery of rules and control information.

150. A method as in any one of the preceding claims further including the step of delivering control information independently of content information that is to be controlled by said control information.

151. A method as in any one of the preceding claims further including the step of allowing a value chain participant to stipulate at least one aspect of information privacy control.

152. A method as in claim 6 wherein arrangement participant A or arrangement participant B is the same as arrangement participant D.

153. A method as in claim 8 wherein at least one of said first and second digital credentials comprises a digital certificate.

154. A method as in claim 19 wherein said trusted, distributed commerce appliances comprise a distributed commerce utility system.

155. A method as in claim 11 wherein differing said usage information is reported to different rightsholders as specified by rules and controls, and said usage information includes at least a portion of said information not provided in useable form to said system service is provided to at least one of said rightsholders in usable form.

156. An electronic clearing arrangement including a central clearinghouse arrangement coupled to plural, distributed clearinghouse nodes remote from said central clearinghouse arrangement, said distributed clearinghouse nodes securely communicating with said central clearinghouse arrangement, one or more of said remote clearinghouse nodes performing digital information usage audit functions and maintaining a database containing a local store of information related to multiple uses of digital information, said electronic clearing arrangement characterized by:

an electronic arrangement at said central clearinghouse arrangement that receives secure information representative of said multiple uses of digital information from said database(s); and

an electronic arrangement that securely supplies rules and controls to said remote clearinghouse nodes, whereby at least one aspect of said uses of said digital information is securely managed in response to at least a portion of said rules and controls, rules and controls securely and separately supplied by at least one third party digital information rightsholder, and said local store of information.

157. A cooperative, distributed rights management commercial system for providing plural system services for use by digital information rightsholders, said system comprising:

plural commerce service arrangements for the performance of system services comprising two or more of (1) financial clearing, (2) usage information clearing, (3) rights and permissions clearing, (4) certificate authority services, (5) directory services, (6) advertising management services, (7) repository, archiving, back up and restore, and/or non-repudiation services, (8) certifying services validating that digital information and/or events have satisfied applicable commerce rules and controls, (9) managing distributed transaction processing in accordance with applicable commerce rules and controls, and (10) user and/or class profiling and/or marketing analysis including assisting in the direction of digital information to one or more specific parties and/or class of parties, said plural commerce service arrangements being interoperable with one another to enable secure, cooperative use of said plural service arrangements: and

an electronic arrangement wherein said plural commerce service arrangements are capable of securely communicating with value chain participant nodes, said value chain participant nodes securely supporting electronic commerce

at least in part through the use of system services provided by plural said commerce service arrangements.

158. A distributed commerce system supporting end-users operating within said system, said end-users using digital information, said system comprising:

plural, separately operated service arrangements for the performance of electronic commerce support services, said plural, separately operated service arrangements receiving digital information reflecting at least a portion of said end-user use of said digital information, said plural, separately operated service arrangements each including a secure communications arrangement for passing digital information reflecting end-user use of said digital information to at least one other of said plural separately operated service arrangements.

159. A rules and controls managed electronic commerce system apparatus for directing the movement of digital information among participants comprising:

at least one identity establishing element that establishes the identity of plural participants in said distributed electronic commerce system;

at least one information acquiring element that acquires user profile and/or preference information associated with said participants and conveys said information to at least one commerce service arrangement;

said commerce service arrangements directing other digital information to at least one of said participants based at least in part upon said conveyed profile and/or preference information; and

at least one secure element that ensures satisfaction of requirements specified by at least one rightsholder having rights in said directed digital information, through use, at least in part, of control information specified by at least one rightsholder.

160. A rules and controls based, distributed commerce apparatus comprising:

plural, separate commerce service provider sites;

plural, separate value chain end-user sites;

at least one value chain defining element that supports, at least in part securely, differing value chains made up of value chain participants comprising different combinations of plural, separate authorized ones of said commerce service providers and plural authorized ones of said end-users; and

a communications arrangement that transfers digital information securely between one or more end-user sites and plural, separate commerce service provider sites in response to commerce rules and controls established by one or more of said value chain participants.

161. A distributed, secure, electronic commerce system having participants comprising commerce utility service providers, product providers, and product users, said system comprising:

means for establishing unique identities for participants within said electronic commerce system;

means for securely delivering a first type of digital information between a system participant A and a system participant B;

means for securely delivering a second type of digital information between said system participant B and a system participant C;

means for securely delivering a third type of digital information between said system participant C and a system participant D; and

means for protecting participant rights at least in part through programmable, secure, rules and controls based governance of use of said types of digital information delivered to, and used by, said participants B and C,

wherein each of said types of digital information comprise one of: (1) digital content, (2) usage information related to usage of said digital content, (3)

instructions used in fulfilling an electronic payment related to usage of said digital content, (4) electronic currency, (5) rules and controls, and (6) profiling and/or preference information of a participant.

162. A distributed computing system supporting peer-to-peer, securely interoperable participant nodes including protected processing environments located at said participant nodes, said system ensuring that value is received in response to an electronic event, said system comprising:

means for enabling the specification of requirements that may be securely associated with discrete digital events for at least in part managing the processing of said events at least in part within said protected processing environments located at said participant nodes;

means for processing a digital event at least in part within a protected processing environment at a first participant's node at least in part in response to an event request authorized by said first participant;

means for requiring compensation from said first participant based, at least in part, on the processing of said digital event at said first participant's node; and

means for requiring compensation from a second system participant based, at least in part, on providing usage information related to said digital event.

163. Apparatus for establishing identity characteristics for automating electronic commerce processes, wherein said apparatus comprises:

means for establishing a unique identifier for a participant and/or a participant commerce installation;

means for securely issuing a first digital credential that identifies a first characteristic of said participant and/or participant installation;

means for securely issuing a second digital credential that identifies a second characteristic of said participant and/or participant installation;

means for associating plural digital credentials corresponding to said characteristics with certain digital information and/or electronic events for usage governance;

means for requesting at least one form of digital processing of said digital information;

means for testing for the presence of said first and second digital credential; and

means for responding to said request based at least in part on said test, wherein said responding to said request is governed at least in part by secured processes operating within said participant's installation.

164. An interoperable, peer-to-peer commerce system for enabling peers to perform certificate authority functions, said system including plural commerce node end-users having associated end-user installations, and at least one digital information rightsholder, said system comprising:

at least one securely interoperable commerce node at a site of a first commerce node end user;

means for enabling said first end user to issue certificates to others of said commerce node end-users and/or end-user installations; and

means for enabling said digital information rightsholder and/or said first end user to at least in part manage usage rights related to certain digital information as a result of said rightsholder and/or said first end-user associating one or more said end-user issued certificates with certain processing of said digital information.

165. A distributed trust platform comprising:

means for securely establishing a unique site identifier;

a secure installation arrangement for securely installing end-user electronic commerce installations and for securely managing software installation and/or software updating;

means for securely associating rules and controls with certain digital information;

means for securely distributing said digital information for use at said end-user electronic commerce installations; and

means for controlling use of at least a portion of said digital information in response to said associated rules and controls.

166. An arrangement for reporting electronic commerce event, user profiling, and surveying information in the context of a system including distributed electronic commerce nodes including means for monitoring usage of digital information and means for securely reporting at least a part of information related to said monitored usage from said commerce nodes to at least one commerce utility system service. at least one portion of said reported usage related information not, in accordance with rules and controls. being provided in useable form to said system service. further characterized by:

an arrangement that electronically instructs said system service. in accordance with rules and controls associated with said reported usage related information, to electronically report to digital information rightsholders.

167. Distributed electronic system apparatus for supporting distributed micro-transaction auditing and processing, said apparatus comprising:

protected, distributed commerce nodes for auditing usage of digital information, plural of said commerce nodes including means for managing micro-payment related activity related to said usage of digital information based. at least in part, on control information provided by a first party; and

at least one commerce utility system that securely receives information reflecting said commerce node auditing of usage information reported by plural of said protected, distributed commerce nodes based, at least in part, on control information provided by a second party different from said first party.

168. In a system including peer-to-peer commercial participant secure commerce nodes for permitting plural parties to participate in a distributed commercial process via electronic instructions, apparatus for transaction authority management of distributed commercial activities, said apparatus comprising:

a transaction authority for assisting in the governance of a distributed commercial process, said transaction authority contributing secure control information for use in governing, at least in part, said distributed commercial process; and

means at said peer-to-peer commercial participant secure commerce nodes for at least in part enforcing said governance.

169. In a communications network for communicating at least in part secured digital information provided by a first commercial party to a second commercial party different from said first commercial party, a distributed electronic security checkpoint system comprising:

at least one checkpoint electronic switch for at least in part receiving said secured digital information, and for interacting with at least a portion of said received secured information, including means for acquiring information related to said secured information, and/or means for at least one of certifying, authenticating, validating, and/or otherwise asserting and/or testing said information so as to provide a trusted commerce service, said checkpoint electronic switch including a communications arrangement for further communicating at least a portion of said secured digital information to said second commercial party different from said first commercial party.

170. A digital broadcasting network, said apparatus comprising:

means for securely providing digital information to plural participants in a cooperative arrangement of network information hosting and/or other service parties;

means for basing variables related to said provision of said digital information at least in part upon the specific attributes of each said party and/or classes to which said parties belong;

means for commercially redistributing at least a portion of said digital information from at least certain of said parties to further parties; and

means for representing said cooperative arrangement to directly and/or electronically negotiate compensation arrangements related to said provision of digital information.

171. A secure messaging system comprising:

means for packaging digital information, at least in part securely, in an electronic container for transmission by a first party;

means for employing a directory service to provide electronic address information to direct said container to at least one additional party;

means for transmitting said container to said at least one additional party;

means for providing authentication for at least a part of said digital information and/or for said container; and

means for preventing said first party from effectively denying that said first party sent at least a portion of said digital information and/or said container to said at least one additional party.

172. In a distributed electronic commerce system including plural protected end-user participant commerce nodes distributed for use by end-user participants in commercial processes, said end-user participant commerce nodes

receiving at least in part protected digital information, a rights repository arrangement disposed remotely from said end-user participants, said rights repository enabling said end-user participant node to securely, separately receive rights permission information from said remote rights repository to, at least in part, enable a desired usage of at least a portion of said digital information at said end-user participant commerce node.

173. A mixed commerce infrastructure comprising:

plural, distributed commerce utility systems providing trusted commerce services;

plural, distributed, trusted commerce appliances supporting end-user electronic commerce activity; and

at least one communications arrangement for securely conveying digital information between said end-user electronic commerce appliances and at least one said commerce utility system, securely conveying digital information between two or more of said commerce utility systems, and securely conveying digital information between said two or more of end-user commerce appliances.

174. A hierarchical commerce infrastructure comprising:

plural trusted, distributed commerce appliances having associated users:

means for establishing a programmed hierarchical rights management relationship between said plural distributed commerce appliances and/or said users of said distributed commerce appliances; and

means for separately producing, at least in part in combination with at least a portion of said programmed hierarchical rights relationship and at least in part by the action of a more hierarchically senior: (a) distributed commerce appliance, (b) user using a distributed commerce appliance, (c) distributed commerce appliance and user, or (d) a plurality of any one or more of (a), (b), or (c) in combination, control information for specifically managing specific activities

performed by hierarchically less senior said commerce appliances and/or users of said appliances.

175. A hierarchical commerce utility system infrastructure for supporting plural trusted end-user commerce nodes, said infrastructure comprising:

a first trusted commerce utility system;

a second trusted commerce utility system less senior than said first trusted commerce utility system; and

means for communicating control information between said first and second commerce utility systems,

wherein said second commerce utility system operates at least in part in accordance with said securely communicated control information to perform a commerce utility service function servicing at least one of said end-user commerce nodes.

176. A virtual computer comprising:

a trusted commerce utility system for at least in part managing use rights related to resources available at plural distributed commerce nodes;

means for establishing use rights information to at least in part govern use of physical and/or logical resources available for use at, at least one of, said distributed commerce nodes;

means for securely communicating at least a portion of said use rights information to said at least one remote distributed commerce node; and

means for employing resources at said at least one said distributed commerce nodes for use in said virtual computing arrangement based, at least in part, on said use rights information

177. A virtual, networked banking system comprising:

a web of plural, separately managed banking protected processing environments; and

a communications arrangement that communicates control information securely between said plural, separately managed banking protected processing environments;

wherein said web of plural, separately managed protected processing environments includes a governing arrangement that governs one or more banking activities, by at least in part managing, at least in part through use of rules and controls, interacting electronic processes at least in part operating under the control of said plural banking protected processing environments, said processes being related to one or more of: (1) the electronic storage of currency, (2) the right to lend money to at least one participant, (3) the fulfillment of payment obligations, (4) the management of electronic bills and/or other obligations, and (5) the ability to deliver or otherwise communicate one or more currency objects.

178. A system for supporting payment settlement related, at least in part, to electronically rights managed electronic commerce, said system including plural distributed electronic commerce nodes located at remote end-user sites, said system comprising:

at least one financial clearinghouse including:

a communications arrangement for securely receiving payment related information from at least one of said distributed electronic commerce nodes; and

a protected processing environment coupled to the communications arrangement, the protected processing environment processing at least a portion of said payment related information, said processing including at least in part governing payment fulfillment information at least in part based upon electronic rights management control information processed.

wherein the communications arrangement securely communicates payment fulfillment related information to at least one of (1) a payment fulfillment organization, and (2) an intended recipient of payment, wherein said payment fulfillment organization and/or intended recipient of payment at least in part employs a protected processing environment to access said payment fulfillment related information.

179. A fulfillment server for efficiently managing electronic requests, said fulfillment server comprising:

a communications arrangement for securely receiving electronic request information from at least one distributed, trusted electronic commerce node and for securely receiving, from a remote location, rule based control information securely associated with said electronic request information, said rule based control information operating with fulfillment server control information to form at least one control set arrangement; and

a processing arrangement coupled to the communications arrangement, the processing arrangement testing to determine what action should be taken with respect to said request information, through the use of at least a portion of said control set arrangement and processing, in accordance with at least a portion of said at least one control set arrangement, a request described by said request information, said processing including one or more of: (a) at least partially fulfilling said request, (b) declining to fulfill said request, and (c) seeking further information related to said request,

wherein said processing arrangement securely responds, through said communications arrangement, to said one of said distributed electronic commerce nodes to provide feedback regarding said request information.

180. A system for supporting delegated electronic rights comprising:

plural distributed trusted electronic commerce nodes for use by plural separate parties; and

a digital credentialing arrangement that associates a digital credential with one or more of said parties and/or nodes, wherein said credential, in combination with protected control information, enables the right to said one or more parties and/or nodes to electronically represent and/or exercise rights possessed by one or more other parties and/or nodes and enables at least one right to represent and/or exercise at least in part through the use of electronic control information.

wherein at least one of said trusted electronic commerce nodes governs said right to represent and/or exercise by processing at least a portion of said control information.

181. A system for supporting a virtual entity comprising:

plural distributed, trusted electronic commerce nodes for use by plural parties, one or more said trusted electronic commerce nodes securely creating one or more digital credentials representing a virtual entity comprising a cooperative participation among plural parties and/or nodes for one or more commercial purposes:

a digital credentialing arrangement that issues digital credentials to said plural parties and/or nodes to at least in part represent the identity of said parties and/or nodes; and

a secure communications arrangement that securely communicates among said plural parties and/or nodes, digital information related to at least in part the identity of said parties and/or nodes,

wherein said system employs at least one of said one or more credentials representing said virtual entity to, at least in part, enable said virtual entity to at least in part participate in at least one commercial process.

182. A system for securely electronically delivering digital information between plural participants employing protected electronic environments, said system comprising:

a secure communications arrangement for securely communicating selected digital information between two or more participant parties supported by at least one trusted service provider participant, wherein said trusted provider supports archiving and/or authenticating of transaction related information;

means at two or more of said trusted electronic environments for securely generating secure control information and for securely governing at least a portion of said communicating and use of said selected, communicated digital information through use of said generated control information;

means coupled to each of said trusted electronic environments for storing information related to communication and/or usage of said communicated digital information at each participant site; and

means at said trusted service provider participant for performing trusted archival and/or authentication services related to said selected digital information

183. An arrangement for reporting electronic commerce event, user profiling, and surveying information in the context of a system including distributed electronic commerce nodes having means for monitoring and governing usage of digital information, and means for collecting user profiling and/or survey information and securely reporting information related to said user profiling and/or surveying from at least one said commerce nodes to at least one commerce utility system service, further characterized by:

an arrangement that electronically instructs said system service, in accordance with rules and controls associated with said communicated profile and/or survey related information, to electronically, securely communicate to at least one digital information rightsholder, certain of said user profiling and surveying information related to usage.

184. A trusted third party certification authority arrangement for use with three or more electronic commerce participant sites each having at least one associated user, said trusted third party certification authority arrangement comprising:

a certifying arrangement for certifying at least one commercial capability, commitment, and/or other attribute related to at least two of said three or more electronic commerce participant sites and/or said users of said sites, and securely providing an associated digital credential to at least one electronic commerce participant site different from said at least two of said three or more electronic commerce participant sites and/or said users of said sites.

wherein said at least one different electronic commerce participant site employs said digital credential in the performance of a commercial activity.

185. A trusted arrangement including trusted installations for coupling trusted and untrusted activities at plural end user commerce nodes and at, at least one, trusted service provider system, each including a computer operating environment employing at least one trusted system component, said trusted installations comprising:

a processor that performs at least one process externally to said at least one trusted component, said process not being concealed from said trusted service provider; and

a communications arrangement that passes and/or receives information from said process to at least one concealed process performed within said internal trusted component,

wherein at least certain internal operations of said internal trusted component are concealed from the users of the trusted arrangement.

186. An infrastructure for multi-nodal commercial processing comprising:

secure electronic commerce node arrangements at independent participant sites for securely processing programmed rights arrangements for, at least in part, securely managing multi-steps of a commercial process; and

at least one communication arrangement for securely communicating at least a portion of said rights control information between a first of said commerce node arrangements and a second of said commerce node arrangements to provide control information to said second commerce node arrangement for enabling the secure management and processing of at least one step of said multi-step process, wherein at least one step of said process occurs at said first commerce node and another step of said multi-step process occurs at said second commerce node.

187. Apparatus as in claim 161 wherein participant A or participant B is the same as participant D.

188. An arrangement as in claim 163 wherein at least one of said first and second digital credentials comprises a digital certificate.

189. An infrastructure as in claim 174 wherein said distributed commerce appliances comprise a distributed commerce utility system.

190. Apparatus as in claim 166 wherein said arrangement that electronically instructs said system service electronically instructs said system service to electronically report differing usage information to different rightsholders as specified by said rules and controls, and wherein said usage information provided to at least one of said rightsholders includes at least a portion of said information not provided in useable form to said commerce utility system service.

191. Apparatus as in any one of the preceding claims 156-190 further including means for performing a negotiation process that supports bidding, auctions or electronic contracts.

192. Apparatus as in any one of the preceding claims 156-191 further including means for supporting a secure multiparty negotiation process.

193. Apparatus as in any one of the preceding claims 156-192 further including means for supporting the independent delivery of rules and control information.

194. Apparatus as in any one of the preceding claims 156-193 further including means for delivering control information independently of content information that is to be controlled by said control information.

195. Apparatus as in any one of the preceding claims 156-194 further including means for allowing a value chain participant to stipulate at least one aspect of information privacy control.

196. In an electronic clearing arrangement including plural, distributed clearinghouse nodes performing digital information usage audit functions and maintaining at least one database containing a local store of information related to multiple uses of digital information, said database including rules securely supplied by at least one digital information rightsholder, and a central clearinghouse facility remote from at least some of said plural, distributed clearinghouse nodes, said central clearinghouse facility including:

a communications arrangement for securely communicating with said plural, distributed clearinghouse nodes, said communications arrangement receiving at said clearinghouse facility information representative of said multiple

uses of digital information from plural distributed clearinghouse nodes' said at least one databases, and securely supplying to said remote clearinghouse nodes, separately from said rules supplied by said digital information rightsholder, rules for securely managing at least one portion and/or other aspect of use of said multiple digital information by said plural, distributed clearinghouse nodes,

wherein said plural, distributed clearinghouse nodes securely manage said at least one portion and/or other aspect of said multiple uses in response to at least a portion of said local store of information and said rules securely and separately supplied by said clearinghouse facility and said at least one third party digital information rightsholder.

197. In a cooperative, distributed rights management commercial system including at least one value chain participant node, said system providing plural system services for use by digital information rightsholders, a commerce service center capable of communicating with said value chain participant mode for securely supporting electronic commerce by at least in part providing said plural system services comprising two or more of (1) financial clearing, (2) usage information clearing, (3) rights and permissions clearing, (4) certificate authority services, (5) directory services, (6) advertising management services, (7) repository, archiving, back up, and/or non-repudiation services, (8) certifying services validating that digital information and/or events have satisfied applicable commerce rules and controls, (9) managing distributed transaction processing in accordance with applicable commerce rules and controls, and (10) user and/or class profiling and/or marketing analysis including tailoring the direction of digital information to one or more specific parties and/or class of parties based at least in part upon said profiling and/or other analysis, said commerce service center being interoperable with at least one other commerce service center to enabling secure, cooperative use of said system services.

198. In a distributed commerce system supporting end-users using digital information, a service operation that performs electronic commerce support services, said service operation receiving digital information reflecting said end-user use of said digital information, said service operation including a secure communications arrangement for communicating digital information reflecting end-user use of said digital information with at least one additional service operation.

199. In a rules managed electronic commerce system for directing the movement of digital information among participants having established identities, a commerce service center comprising:

a communications arrangement for receiving acquired user profile and/or preference information associated with said participants; and

a directing arrangement for directing other digital information to at least one of said participants based at least in part upon said conveyed profile and/or preference information, said directed digital information at least in part ensuring satisfaction of requirements specified by rightsholders in said directed digital information through use, at least in part, of rules and controls specified by said rightsholders

200. In a rules and controls based, distributed commerce system comprising plural, separate commerce service providers and plural, separate value chain end-users, a method of providing services comprising:

receiving authorization;

in response to said received authorization, participating in a first commercial arrangement involving plural participants comprising a combination of plural, separate authorized commerce service providers and plural authorized end-users; and

transferring digital information securely between one or more end-user sites and plural, separate commerce service providers in response. at least in part, to commerce rules and controls established by one or more of said participants.

201. In a system for reporting electronic commerce events, user profiling, and surveying information, said system including distributed electronic commerce nodes that securely monitoring usage of digital information and securely report information related to said monitored usage from said commerce nodes to at least one commerce utility system service, at least one portion of said reported usage related information not, in accordance with rules and controls, being provided in useable form to said system service, said commerce utility system service including an arrangement that electronically controls, in accordance with rules and controls associated with said reported usage related information, electronic reporting to digital information rightsholders of certain of said information related to usage, and reports differing usage information to different rightsholders as required by rules and controls, and wherein said usage information includes at least some information not provided in useable form to said commerce utility system service.

202. In a distributed electronic system for supporting distributed micro-transaction auditing and processing, said system including protected, distributed commerce nodes for auditing usage of digital information, at least some of said commerce nodes including means for managing micro-payment related activity related to said usage of digital information based, at least in part, on control information provided by a first party, said system further characterized by at least one commerce utility system that securely receives information reflecting said commerce node auditing of usage information reported by said protected, distributed commerce nodes based, at least in part, on control information provided by a second party different from said first party.

203. An electronic commerce and/or rights management system for performing at least one clearing operation, the system comprising:

- a first electronic appliance (100),
- a second electronic appliance (100'), and
- an electronic communications network (150) that allows the first and second electronic appliances (100, 100') to exchange digital signals.

characterized in that:

- the first electronic appliance (100) performs at least a first part of the clearing operation, and
- the second electronic appliance (100') performs at least a second part of the clearing operation.

204. An electronic commerce and/or rights management system as in claim 203 further characterized in that the first part of the clearing operation includes at least one micropayment aggregation task, and the second part of the clearing operation includes at least one payment settlement task.

205. An electronic commerce and/or rights management system as in claim 203 further characterized in that the first electronic appliance (100) comprises a consumer appliance, and the second electronic appliance (100') is installed, at least in part, within a clearing institution.

206. An electronic commerce and/or rights management system as in claim 203 further characterized in that at least the first electronic appliance (100) includes a protected processing environment (154).

207. An electronic commerce and/or rights management system as in claim 203 further characterized in that the first part of the clearing operation

comprises a usage metering task (116).

208. An electronic commerce and/or rights management system as in claim 203 further characterized in that the first part of the clearing operation comprises at least one task conditioned on a digital certificate (504).

209. An electronic commerce and/or rights management system as in claim 203 further characterized in that the first part of the clearing operation comprises at least one rights management task.

210. An electronic commerce and/or rights management system as in claim 203 further characterized in that the first part of the clearing operation comprises at least one electronic currency management task.

211. An electronic commerce and/or rights management system as in claim 203 further characterized in that most of the clearing operation is performed by the first appliance (100).

212. An electronic commerce and/or rights management system as in claim 203 further characterized in that most of the clearing operation is performed by the second appliance (100').

213. An electronic commerce and/or rights management system as in claim 203 further characterized in that the system further includes a third electronic appliance (100'') coupled to at least one of the first and second electronic appliances (100, 100') through the network (150), the third electronic appliance performing a third part of the clearing operation.

214. An electronic commerce and/or rights management system as in

claim 203 further characterized in that each of the first and second appliances (100, 100') are capable of performing any of a financial clearing operation, a usage clearing operation, a rights and permissions clearing operation, a certifying authority operation, a transaction authority operation, and a secure directory services operation, and each of said operations may be distributed in different ways between the first and second appliances (100, 100').

215. An electronic commerce and/or rights management system as in claim 203 further characterized in that the electronic network (150) couples the first and second electronic appliances (100, 100') to a commerce utility system web.

216. An electronic commerce and/or rights management system as in claim 203 further characterized in that an electronic rights holder can electronically choose between the first electronic appliance (100) and the second electronic appliance (100').

217. An electronic commerce and/or rights management system as in claim 203 further characterized in that the first and second electronic appliances (100, 100') work together to perform overall transaction clearing.

218. An electronic commerce and/or rights management system as in claim 203 further characterized in that each of the first and second appliances (100, 100') performs each of: at least one financial clearing operation, at least one usage clearing operation, at least one rights and permissions clearing operation, at least one certifying authority operation, at least one transaction authority operation, and at least one secure directory services operation.

219. An electronic commerce and/or rights management system as in

claim 203 further characterized in that the first electronic appliance (100) comprises a hierarchy of plural commerce utility systems (90(1), ... 90(n)).

220. An electronic commerce and/or rights management system as in claim 203 further characterized in that the first electronic appliance (100) is organization-specific.

221. An electronic commerce and/or rights management system as in claim 203 further characterized in that the first electronic appliance (100) is vertically specialized.

222. An electronic commerce and/or rights management system as in claim 203 further characterized in that the first electronic appliance (100) is specialized by territory and/or jurisdiction.

223. An electronic commerce and/or rights management system as in claim 203 further characterized in that the first and second electronic appliances (100, 100') communicate and coordinate as peers and in a hierarchy.

224. An electronic commerce and/or rights management system as in claim 203 further characterized in that that clearing operation includes processing payment related information, and performing at least one payment related transaction.

225. An electronic commerce and/or rights management system as in claim 203 further characterized in that that clearing operation includes processing usage related information and performing at least one usage reporting action.

226. An electronic commerce and/or rights management system as in

claim 203 further characterized in that that clearing operation includes receiving at least one request, and performing at least one associated rights management transaction.

227. An electronic commerce and/or rights management system as in claim 203 further characterized in that that clearing operation includes issuing at least one digital certificate.

228. An electronic commerce and/or rights management system as in claim 203 further characterized in that that clearing operation includes securely providing directory information.

229. An electronic commerce and/or rights management system as in claim 203 further characterized in that that clearing operation includes performing at least one process management transaction.

230. An electronic commerce and/or rights management system as in claim 203 wherein the first and second parts of the clearing operation support one another.

231. An electronic commerce and/or rights management system as in claim 203 wherein at least one of the first and second electronic appliances (100, 100') includes a rights operating system that supports a collection of service application components defining at least one service function.

232. A method for supporting a commercial electronic commerce infrastructure enabling plural networked commercial arrangements, said method comprising the steps of:

- a. Providing security, communication, and certification information for maintaining an interoperable framework for distributed, trusted, programmable electronic commerce
- b. Supporting, within said framework, rights components and/or other rights language for operation within protected electronic commerce installations separately operated by electronic commerce participants
- c. Participating, by plural such participants, in programmed commercial webs, plural of said webs involving differing combinations of said separately managed protected processing environments
- d. Governing, at least in part; the operation of said commercial webs through the enforcement of control information within said protected electronic commerce installations, wherein such control information processed within at least one of said protected electronic commerce installations was specified by at least two of said web's participants

233. A method for securely governing a multi-nodal commercial process, said method comprising

- a. Operating distributed, secure electronic commerce nodes at independent participant sites
- b. Programming plural, differing commercial rights arrangements for processing within plural of said secure electronic commerce nodes
- c. Communicating securely said rights information to at least in part securely manage the operation of a multi-nodal multi-step process
- d. Managing at least in part securely a commercial process at least in part under the control of said rights information operating within secure electronic commerce nodes, wherein at least one step securely occurs at one independent site and another step securely occurs at a second independent site

# INTERNATIONAL SEARCH REPORT

International Application No  
PCT/US 96/14262

<b>A. CLASSIFICATION OF SUBJECT MATTER</b> IPC 6 G07F7/00 G07F7/10 G06F17/60		
According to International Patent Classification (IPC) or to both national classification and IPC		
<b>B. FIELDS SEARCHED</b> Minimum documentation searched (classification system followed by classification symbols) IPC 6 G07F G06F G07G		
Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched		
Electronic data base consulted during the international search (name of data base and, where practical, search terms used)		
<b>C. DOCUMENTS CONSIDERED TO BE RELEVANT</b>		
Category *	Citation of document, with indication, where appropriate, of the relevant passages	Relevant to claim No.
A	EP 0 370 146 A (STRATEGIC PROCESSING CORP) 30 May 1990  see column 6, line 22 - column 16, line 32 see claims 1-24; figures 1,2,20-24 ---	1,2,4,6, 10,11, 13,15, 17-22, 25,28
A	EP 0 725 376 A (SONY CORP) 7 August 1996  see the whole document ---	1-5, 7-16, 19, 22-24, 29
A	WO 96 13013 A (OPEN MARKET INC) 2 May 1996  see abstract; claims 1-12,40; figures 1-4 --- -/--	1-3,6, 8-11
<div style="display: flex; justify-content: space-between;"> <span><input checked="" type="checkbox"/> Further documents are listed in the continuation of box C.</span> <span><input checked="" type="checkbox"/> Patent family members are listed in annex.</span> </div>		
* Special categories of cited documents :		
<div style="display: flex; justify-content: space-between;"> <div style="width: 45%;"> <p>* "A" document defining the general state of the art which is not considered to be of particular relevance</p> <p>* "E" earlier document but published on or after the international filing date</p> <p>* "L" document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)</p> <p>* "O" document referring to an oral disclosure, use, exhibition or other means</p> <p>* "P" document published prior to the international filing date but later than the priority date claimed</p> </div> <div style="width: 45%;"> <p>* "T" later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention</p> <p>* "X" document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone</p> <p>* "Y" document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art.</p> <p>* "&amp;" document member of the same patent family</p> </div> </div>		
Date of the actual completion of the international search  <div style="text-align: center; font-size: 1.2em;">17 July 1997</div>		Date of mailing of the international search report  <div style="text-align: center; font-size: 1.2em;">25. 07. 97</div>
Name and mailing address of the ISA European Patent Office, P.B. 5818 Patentlaan 2 NL - 2280 HV Rijswijk Tel. (+ 31-70) 340-2040, Tx. 31 651 epo nl, Fax (+ 31-70) 340-3016		Authorized officer  <div style="text-align: center; font-size: 1.2em;">Guivol, O</div>
